CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 1 **JANUARY 1966**

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Cold month, except mild in Pacific Northwest and Maine.
2. Severe blizzard at end of month in East.
3. Heavy precipitation southeast coastal areas.

TEMPERATURE.--Temperatures for January 1966 averaged below normal everywhere in the 48 states, except above normal in northern sections west of the Continental Divide, in Maine, and the southern tip of Florida. The coldest section, relative to normal, was the northern Great Plains where Arctic air dominated the weather virtually the entire month and temperatures averaged 9° to 12° below normal. This was the sixth consecutive cold January in the Southeast and the third consecutive January with above normal temperatures in the Pacific Northwest. For the week ending January 23, temperatures averaged below normal in nearly all areas, except New York and New England. In much of the midcontinent area and parts of the Southeast, this January was among the 10 coldest of record. It was the fourth coldest on record at Minneapolis, Minn., and Amarillo, Tex., third coldest at Macon, Ga., the coldest since 1948 in the lower Appalachian region, and since 1950 in the extreme northern Great Plains. Fuel consumption, owing to the cold weather, was 25 to 40 percent above normal for the month in midcontinent areas.

The second half of the month was extremely cold in the midcontinent area and Southeast. Temperatures for the last 2 weeks of the month in this region averaged from 12° to 20° or more below normal. Subzero minima reached all the Southern States, except Louisiana and Florida, and only the southern tips of Florida and Texas and parts of the California coast escaped freezing.

Lowest temperatures in most areas east of the Rockies occurred during a great cold wave the closing days of the month. The lowest temperature in the 48 states was -50° recorded at Baudette, Minn., on the 28th. On the 30th Russellville, Ala., reported -24°, the lowest temperature ever recorded in Alabama. The maximum temperature was -26° at International Falls, Minn., on the 28th and 2° at Knoxville, Tenn., on the 30th. At Corpus Christi, Tex., temperatures were below freezing for 11 to 12 hours during the night of the 29th-30th and 1/2 to 3/4 inch of ice was reported in the city. In Florida, lowest temperatures ranged from 11° at Pensacola to 47° at Key West; Miami had 35°.

PRECIPITATION.--Precipitation was above normal from southeast Texas through Florida and northward through the Atlantic Coastal States, except slightly below in New Jersey, southeastern New York, and much of New England. There were a few other areas in the Midwest and West with above normal amounts. In most of the area west of the Appalachians, however, amounts were below normal, and central Missouri, eastern Kansas, and a large part of the Great Basin had less than 25 percent of normal. Precipitation in the Northeast was sufficient to greatly help the drought situation; moisture was adequate from an agricultural basis, but more moisture was needed to replenish reservoirs and restore ground water to normal.

Frequent storms moved across the Gulf States and up the Atlantic coast. Several other storms crossed the northern tier of states. The main storms in the East occurred on the 5th and 6th; about midmonth, 23d and 24th, 26th, and 29th and 30th. Precipitation from these storms totaled over 4 inches from southeast Texas to Florida and up the coast to Delaware. Baton Rouge, La., reported the wettest January since 1925, and totals exceeding 12 inches were reported in the southeastern part of that State. On the West Coast monthly totals ranged from an inch in the south to over 12 inches in the north.

At the end of the month seasonal rainfall at San Diego, Calif., was the second greatest of record.

SNOW.--At the beginning of the year snow covered most interior sections of the Far West but only extreme northern areas east of the Rockies. Frequent, widespread snowstorms during the month added a few inches, to more than 2 feet, to the existing cover and greatly expanded the cover east of the Rockies. At the end of January, depths ranged up to 46 inches in Maine, 32 inches in Upper Michigan and northern Minnesota, and 172 inches in the northern Cascades.

Total snowfalls for the month set new records at several locations in the East. Among these were Worcester, Mass., 44 inches; Syracuse and Rochester, N. Y., 71 and 60.2 inches, respectively; Burlington, Vt., 41.3 inches; Lynchburg, Norfolk, and Roanoke, Va., 31.8, 14.2, and 41.2 inches, respectively. On the 26th occurred the heaviest continuous falls in North Carolina in 30 years, and depths reached a foot in some parts of the Piedmont, over 2 feet in the northern mountains, and 1 to 2 inches in the coastal plains.

SEVERE STORMS AND OTHER ADVERSE WEATHER CONDITIONS.--During a storm in the Northeast on the 8th, most of New England received 5 to 15 inches of snow with heaviest amounts in eastern Massachusetts; blizzard conditions prevailed in parts of eastern New England in the afternoon.

In western Washington during the first week, highway passes in the Cascades were blocked several times by snowslides, and mudslides caused property damage in the Puget Sound area.

During another storm in the Northeast on the 23d and 24th, 5 to 20 inches of snow fell over most of New England where a combination of high winds and wet snow caused widespread power failures. In New York State, snowfalls ranged from 8 to over 12 inches, except 1 to 3 inches on coast. High tides along the north Atlantic coast during this storm caused considerable damage.

The stormiest conditions east of the Rockies occurred during the closing days of the month. A combination of high winds, heavy snowfall, and low temperatures produced blizzard conditions as far south as Arkansas in the Midwest on the 28th and 29th and over the Northeast and Middle Atlantic Coastal States on the 29th, 30th, and 31st. Blizzard conditions, the worst since February 16, 1958, occurred from northern Virginia and the lower Appalachians northward. Eight to over 20 inches of snow covered the ground throughout the area. With huge drifts blocking highways, transportation almost came to a halt. In the Nation's Capitol, 16 inches of snow covered the ground after the storm; impassable side streets in the city prevented fuel deliveries, and blocked roads in surrounding areas caused considerable dumping of milk, and offices and business were closed on the 31st.

CONDENSED CLIMATOLOGICAL SUMMARY

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

V Sun below horizon January 1-23, inclusive.
X Sun below horizon January 1-17, inclusive.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

V Sun below horizon January 1-23, inclusive.
X Sun below horizon January 1-17, inclusive.

° Includes crop damage
C Crop damage
R Rain
S Several
L Local flooding
N No report received by printing deadline.

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.
† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

JANUARY 1966

Damaging floods occurred along tributary streams in the White Basin in Arkansas during January. Flooding on the Black River was the most severe since 1927. The damages from the flooding Cache River was the greatest in several years. Major flooding occurred along northern California streams. Considerable damage was sustained and many families were evacuated from their homes.

ST. LAWRENCE DRAINAGE

Lake Erie.--Minor flooding began on the St. Joseph River at Montpelier, Ohio, on December 25 and continued until January 4. This flooding was due to heavy rains (over 3 inches) on the 24th-25th. Farmland and park areas in and near Montpelier were affected. A secondary crest of 10.9 feet occurred on January 2 (flood stage 10 feet).

ATLANTIC SLOPE DRAINAGE

Minor flooding occurred on the Savannah River at Clyo, Ga., on the 21st-23d and on the Ogeechee River beginning at Dover, Ga., on the 26th. Light overflow was in progress at Eden, Ga., at the close of the month. Little or no damage resulted.

Light flooding occurred on the Ocmulgee River at Macon, Ga., from the 15th to the 18th. Light flooding began on the Altamaha at Charlotte, Ga., on the 27th and continued into February. The Satilla River at Atkinson, Ga., rose 2 feet above flood stage on the 31st.

EAST GULF OF MEXICO DRAINAGE

Two periods of heavy rain during January 1966 over the Apalachicola River System produced substantial rises but no flooding except at Blountstown, Fla. The first heavy rain occurred from the 4th to the 6th, with accumulated totals of 3 to 3.5 inches in middle streams and over the Chattahoochee headwater area. In lower streams, rainfall totals were generally less than 2 inches. The second period of heavy rain on the 14-15th produced rainfall total of 3 to 4 inches over much of the middle and lower portions. In the Chattahoochee headwater area, rainfall totals ranged from 2 to 2.5 inches. Strong rises resulted from the heavy rains, especially from those of the 14-15th. Considerable acres of wooded but unpopulated areas were inundated, causing a slowdown or temporary stoppage of logging operations, but no damages resulted.

About 3.5 inches of rain during the first week in January caused the Pearl River at Jackson, Bogalusa, and Pearl River, La., to rise slightly above flood stage. Subsequent rains throughout the month maintained the river near or slightly below flood stage the entire month. The river heights were not excessive and the river was well contained in its banks and immediate flood plain. Damages were minor.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Ice action caused the Kankakee River to rise 1.3 feet above flood stage at Momence, Ill., on the 28th. It was back within its banks by the 29th.

Heavy precipitation on December 23 and 24 produced flooding along the Illinois River which continued into January at and below La Salle, Ill. The river crested at La Salle, Ill., on December 26, 3.2 feet above flood stage and receded below flood stage on January 3. Additional rainfall, measuring up to 2 inches, occurred at the end of December and on the first of January in Illinois and Missouri. The river crested at Havanna, Ill., 1.4 feet above flood stage on the 5th. The crest reached Meredosia, Ill., on the 8th, 2.6 feet above flood stage. The Illinois was back within its banks at all points by the 21st. A sharp temperature drop, beginning on the 20th and continuing cold the balance of the month, created heavy ice conditions on the Illinois which resulted in erratic stage fluctuations. By the end of January all navigation pools continued to be ice-covered.

Minor flooding occurred on the Kaskaskia River at Carlyle, Ill., on the 5th.

Ohio Basin.--Excessive rains during the first week of January produced minor flooding on Paint Creek and the lower Scioto River in Ohio. No damage resulted since most of the inundated area was farmland not in production at the time. The first deep penetration of frost occurred during the second week of the month. The first heavy snow cover followed during the third week.

White Basin.--Heavy rain over the northern part of Arkansas and southern Missouri from the evening of December 31 until the early morning hours of January 2 caused flooding on many streams in the White Basin. Rainfall during this period averaged about 4-1/2 inches. Rainfall over the Black Basin averaged about 5 1/2 inches and over the Cache Basin above Patterson, Ark., about 7 inches. The heaviest rain occurred in the Walnut Ridge, Ark., area, ranging from 8.75 inches at Corning, Ark., to 10.04 inches at Paragould, Ark.

The flooding on the Black River was the worst since 1927. The lower portion went above flood stage during the afternoon of the 1st. The entire Black in Missouri and Arkansas was above flood stage from the 2d to the 19th. Extensive damages occurred to public property and roads in Arkansas. Many families in the west part of Walnut Ridge had to be evacuated due to the flooding of Village Creek. Several highways were closed.

Extensive flooding occurred along the Cache River at Patterson, Ark., from the 2d through the end of the month. Extensive damages occurred to public and private property. Portions of highways 91 and 226 were closed. Many houses east of Des Arc, Ark., were surrounded by water. This was the greatest damage resulting from the flooding Cache River in several years.

The Buffalo River rose rapidly to 3 feet above flood stage at Gilbert, Ark., on the morning of the 2d. Roads in Newton County were damaged. There was also some erosion to croplands.

The Little Red River at Judsonia, Ark., was above flood stage on the 2d and 3d. The State highway from Searcy to Pangburn was closed for a time. Losses to livestock were minor as they were moved from the area.

The White River went above flood stage at Batesville, Ark., on the 2d and receded within its banks at St. Charles, Ark., on the 31st. Considerable damage resulted to crops in four counties.

Lower Mississippi Basin.--Heavy rain on January 1 and 2 caused a rapid rise in the St. Francis River to above flood stage at Fisk, Mo., and St. Francis, Ark., on the 2d. The 2-day totals ranged from 8.95 inches at Wappapello Dam to 1.69 inches at Fredericktown with an average of 5.3 inches. Additional rains of 1 to 1 1/2 inches on the 5th and 6th caused increased discharge and the stage of the St. Francis River rose to 20.8 feet at St. Francis, Ark., on the 7th. The local rain caused the crest to be reached before maximum discharge from upstream reached St. Francis. The damages from this overflow was relatively light as very few areas had been planted in winter crops.

WEST GULF OF MEXICO DRAINAGE

The flooding on the Calcasieu River at Hineston, La., which began on the 25th and continued into the next month was due to heavy rain on the 20th, 25th, and 29th. No damage was reported.

Minor lowland flooding occurred on the Trinity River near Moss Bluff, Tex., from the 27th to the 29th. This overflow was due to moderate rains on the 19th-22d followed by heavy rains on the 25th. Little, if any damage resulted.

GULF OF CALIFORNIA DRAINAGE

Heavy runoff from warm rain and melting snow on December 30 produced flooding along the upper Gila and San Francisco Rivers from December 30 to January 3. At Cliff, N. Mex., the upper Gila was out of its banks from December 31 to January 1. A crest, 2 1/2 feet above flood stage, occurred about noon on December 31. Preliminary estimates of damage to farmland, river crossings, and irrigation systems was $200,000.

PACIFIC SLOPE DRAINAGE

Sacramento Basin.--Heavy rains over northern California during the first week in January brought a substantial rise to the Sacramento River. The upstream weirs of the Sacramento River Flood Control System overflowed between the 5th and 13th. No overflow occurred at the Fremont Weir, the largest weir of the system. At Sacramento, Calif., the stream crested 12 feet below flood stage.

Moderate flooding occurred on the Russian River during the period from the 4th to the 7th. There was also flooding in Marin County just north of San Francisco, Calif., from the heavy rains and overflowing of Corte Madera Creek. Slight flooding occurred in the lowlands of the Napa River, south of St. Helena, near Rutherford, Calif. This flooding was due to rain which began during the last week of December and continued through the first week of January. About 5 inches of rain fell in the Russian Basin in the 24-hour period, midnight to midnight, January 4, of which 4 inches occurred in 16 hours. The U. S. Army Corp of Engineers preliminary estimates of flood damage in the Russian Basin was $2 1/2 million. About two-thirds of this damage was to residences and resort businesses in the Guerneville, Calif., area. The remaining one third was to orchards, farmlands, and flood control levees. Preliminary estimates of damage in Marin County from the heavy rains and overflowing of Corte Madera Creek was $600,000. Practically all of this was to residential property. In some low-lying areas of Kentfield, flood water was as much as 4 feet deep. Many families had to be evacuated and some roads were temporarily closed.

Heavy rains on the 3d, 4th, and 5th in northern California caused major overflow along northern California coastal streams. In the Eel Basin, the South Fork crested nearly 6 feet above flood stage on the 4th. Along the main stem of the Eel, more than 7 feet of overflow occurred at Fernbridge, Calif. The Mad River at Arcata, Calif., crested nearly 3 feet above flood stage on the 4th. At Orick, Calif., Redwood Creek rose 3 feet out of its banks on the 4th. The Trinity River at Hoopa, Calif., crested more than 3 feet over flood stage on the 5th. Three and one-half to 6 feet of overflow occurred along the Smith River. Considerable damage resulted from the flooding. Many families had to be evacuated from their homes.

Heavy rainfall which began in southwestern Oregon on the 2d and continued through the 6th caused flooding for the second consecutive month in the Coquille Basin. The Umpqua River which was saturated from the late December rains rose to 1-1/2 to 3 feet above flood stage. The limited amount of rain over the Rogue Basin during the latter part of December allowed much of the early January rains to be absorbed. The Rogue River rose slowly from the rain on the 2d to the 4th and crested well below flood stage. The heavy rain on the 6th, with its much higher freezing level, resulted in minor overflow on the same date. Damage along the Rogue and Illinois Rivers was minor and limited to streambank erosion. Several trailer camps along the low-lying portions of the rivers were evacuated. The damage along the Umpqua Basin was limited to residential property. Major damages occurred along the Coquille River from the prolonged flooding.

Columbia Basin.--Heavy precipitation from the 2d to the 6th caused tributary flooding in the Willamette Basin. Streams had receded to well below bankfull stage when the second major storm series of the 1965-66 winter season moved into the Willamette Basin. Low elevation tributary streams experienced the first minor crest on midnight of the 2d. The second streamflow rise, which resulted in overbank flow on coast range Willamette tributaries, crested on the 4th. These two rises caused the middle Willamette to rise to within 1 foot of bankfull stage. The freezing level during these initial two storms remained at about 3,000 feet. Freezing levels rose to about 7,000 feet on the 5th. By evening of the 5th, 1.5 inches of precipitation had fallen over much of the basin. Both Coast and Cascade Range tributaries rose rapidly. The total precipitation during this storm period averaged from 5.75 inches for the Willamette Valley Stations to 8.5 inches for the Coast Range and Cascade Range Willamette Stations. Damages to crops, flood control structures, dwellings, movable equipment, and from bank erosion were estimated at $1,400,000 by the Corps of Engineers.

Chehalis Basin.--Minor flooding occurred along the Chehalis River in Washington from the 6th to the 8th. The high water was due to a combination of heavy rain, ranging from 2 to 4 inches over the lower elevations, and snowmelt. No damage was reported from the flooding.

Recipients of Environmental Data Service
and Weather Bureau Publications

Beginning early in 1966 the organization titles of our publications were changed. This change in organization titles will not affect the publication title and series numbering. These items will continue without change, so that it will not be necessary for you to set up new files or new card catalog entries.

The change in organization titles was made necessary by the consolidation of the Weather Bureau, Coast and Geodetic Survey, and Central Radio Propagation Laboratory of the National Bureau of Standards into a single organization known as Environmental Science Services Administration.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available.

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from lithium chloride hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots.

Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. They were also equipped with carbon hygristors. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.C.T.

R More than half of the observations are from statistical values.

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont. JANUARY 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	-52	-32	-35	44	43	7	37	-10	-64	24	10	5	31	31	22	38	0	-12	-3	8	10	41	29	12	-38	-4	56	70	58	25	33	12

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																														Mean O3
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick The code λ s designates the type of measurement made

DESCRIPTION of CHARTS

CHART I., A. AVERAGE TEMPERATURE (°F.) AT SURFACE. B. DEPARTURE OF AVERAGE TEMPERATURE FROM NORMAL. -The average monthly temperature presented in Chart I-A is computed from the average daily maximum and the average daily minimum temperatures reported by some 870 Weather Bureau and cooperative stations. The departures from normal are presented in Chart I-B. They are based on the 30-year normals (1931-60) for the first-order Weather Bureau stations.

CHART II. TOTAL PRECIPITATION. - Chart II is based on daily precipitation records at about 870 Weather Bureau and cooperative stations.

CHART III. PERCENTAGE OF NORMAL PRECIPITATION. -In this chart the anomaly in the month's precipitation is shown as a percentage of the normal total. This anomaly shows the deviation from the 30-year normal (1931-60) for about 270 first-order Weather Bureau stations.

CHART IV. TOTAL SNOWFALL. CHART V. A. PERCENTAGE OF MEAN MONTHLY SNOWFALL. B. DEPTH OF SNOW ON GROUND.-Chart IV gives the total depth in inches of unmelted snowfall as reported during the month by Weather Bureau and cooperative stations. This is converted in Chart V-A into a percentage of the mean monthly total amount computed for each Weather Bureau station having at least 10 years of record. The depth of snow on ground is that reported by both Weather Bureau and cooperative stations as of 7:00 a. m. Eastern Standard Time on the Monday nearest the end of the month. This is reported only for the months December through March. The snowfall charts are presented each month November through April.

> Isolines for Charts I, II, III, IV, and V, are drawn through points of approximately equal value. Caution should be used in interpolating on these charts, particularly in mountainous areas.

CHART VI. A. PERCENTAGE OF POSSIBLE SUNSHINE. B. PERCENTAGE OF MEAN MONTHLY SUNSHINE. -CHART VI-A shows the amount of sunshine received in terms of percentage of the total hours of sunshine possible during the month. In Chart VI-B this is shown as a percentage of the mean number of hours of sunshine received. Means are computed for Weather Bureau stations having at least 10 years of record.

CHART VII. A. AVERAGE DAILY VALUES OF SOLAR RADIATION, LANGLEYS. B. PERCENTAGE OF MEAN DAILY SOLAR RADIATION. -Shown on Chart VII-A are the monthly averages of daily total solar radiation, both direct and diffuse, in langleys (gm. cal. cm. $^{-2}$) for all Weather Bureau stations which record this element.

CHART VII-B shows the percentages of the mean based on at least 5 years of record during the period 1950-1960, and corrected to the International Pyrheliometer Scale of 1956.

CHART VIII. -TRACKS OF CENTERS OF ANTICYCLONES AT SEA LEVEL.

CHART IX. TRACKS OF CENTERS OF CYCLONES AT SEA LEVEL. -Centers which can be identified for 24 hours or more are tracked in these charts. Semi-permanent features such as the Great Basin and Pacific Highs and Colorado and Mexico Lows are not shown. The 7:00 a. m. EST positions are shown by open circles, with the intermediate positions at 6-hour intervals shown by solid dots. The date is given above the circle and the central pressure to whole millibars below. A dashed track indicates a regeneration rather than actual movement to the next position. Solid squares indicate position of stationary center for period shown beside it.

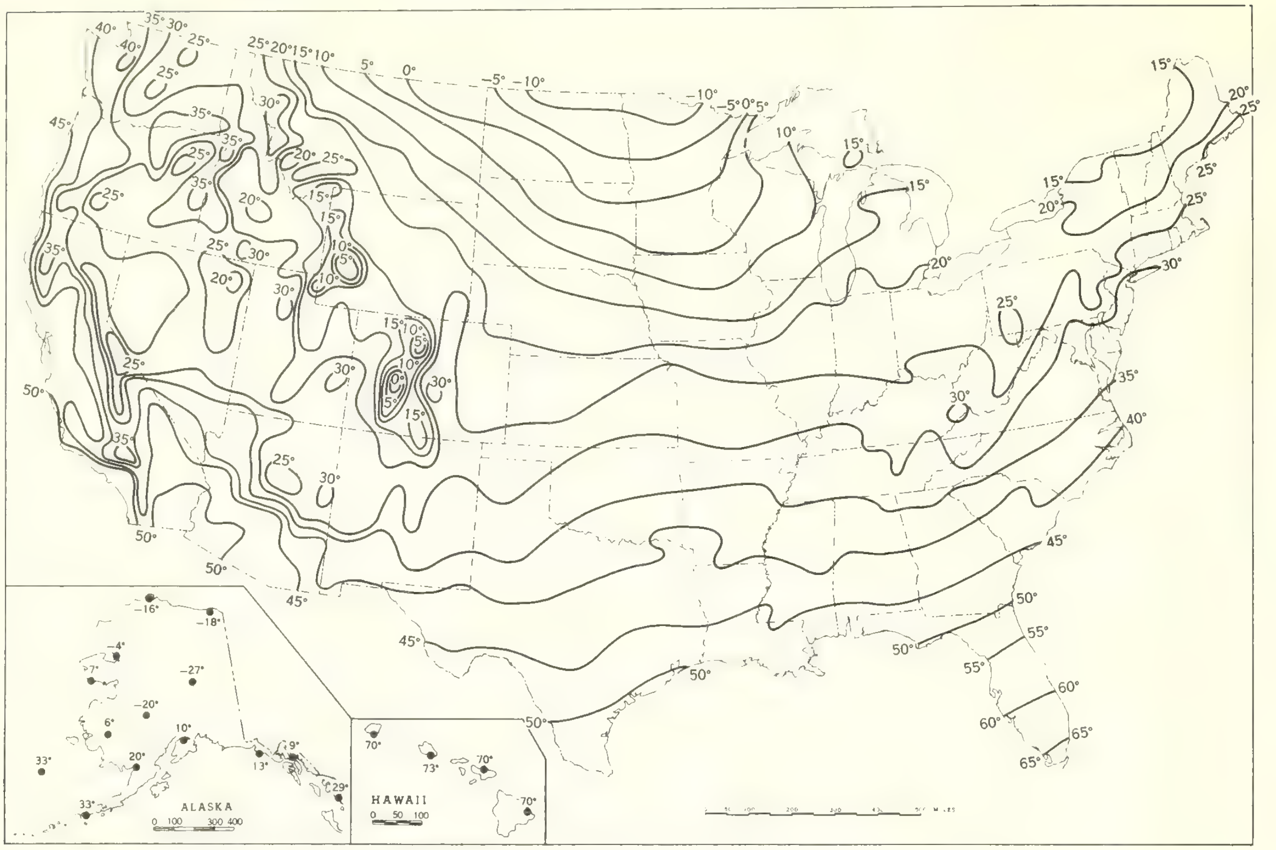
CHART X. AVERAGE SEA LEVEL PRESSURE (mb.) AND RESULTANT SURFACE WIND.-The average monthly sea level pressures are obatined from the eight daily 3-hourly observations reported at Weather Bureau Stations. Resultant surface wind directions (to 36 points of the compass) for the month are shown by arrows. Resultant speeds are indicated by the length of arrow shafts. Constancy ratios (resultant surface wind divided by average surface wind for month) are shown to two decimal places. The inset shows the departure of the average pressure based on 30-year normals for first-order Weather Bureau Stations, other stations having at least 10 years of record; and for each 10° intersection in a diamond grid over the oceans.

CHARTS XI-XVI. AVERAGE HEIGHT, TEMPERATURE, AND RESULTANT WINDS, 850, 700, 500, 300, 200, and 100 mb. -Height is given in geopotential meters and temperature in degrees Celsius. These are the averages of the 1200 GMT radiosonde reports. Wind speeds are given in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. Directions are shown to 360° of the compass. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

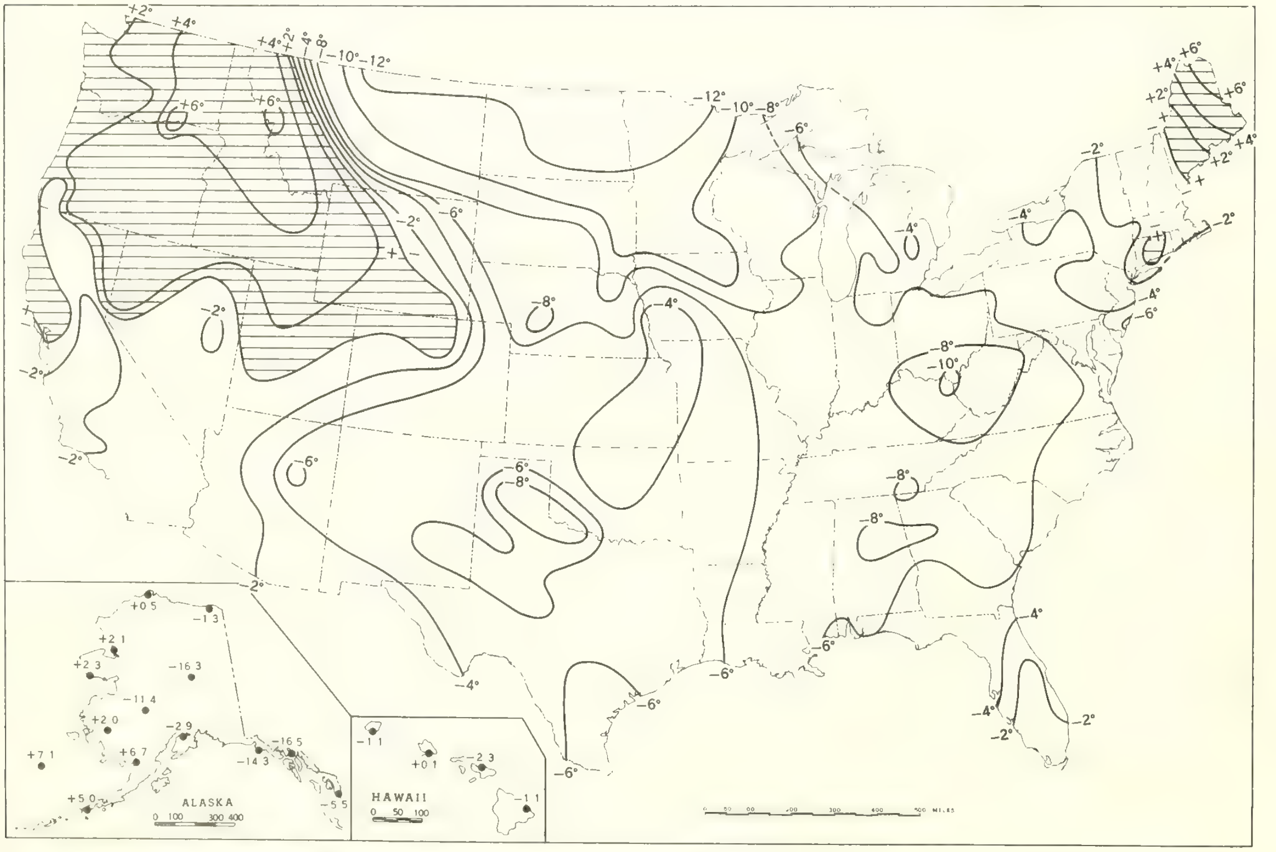
CHART XVII. A. 50-MB. RESULTANT WINDS. B. 30-MB. RESULTANT WINDS. -Wind speed (isotachs) in knots. Arrows show resultant wind direction. Winds are based on rawins at the indicated pressure surface and at 1200 GMT.

Exact values of most of these charted elements for Weather Bureau stations are printed each month in tabular form in CLIMATOLOGICAL DATA, NATIONAL SUMMARY. Extreme values of temperature and precipitation for each state are included in the tables, Condensed Climatological Summary. Annual averages for surface elements are presented in the CDNS Annual Issue each year.

Chart I. A. Average Temperature (°F.) at Surface, January 1966.



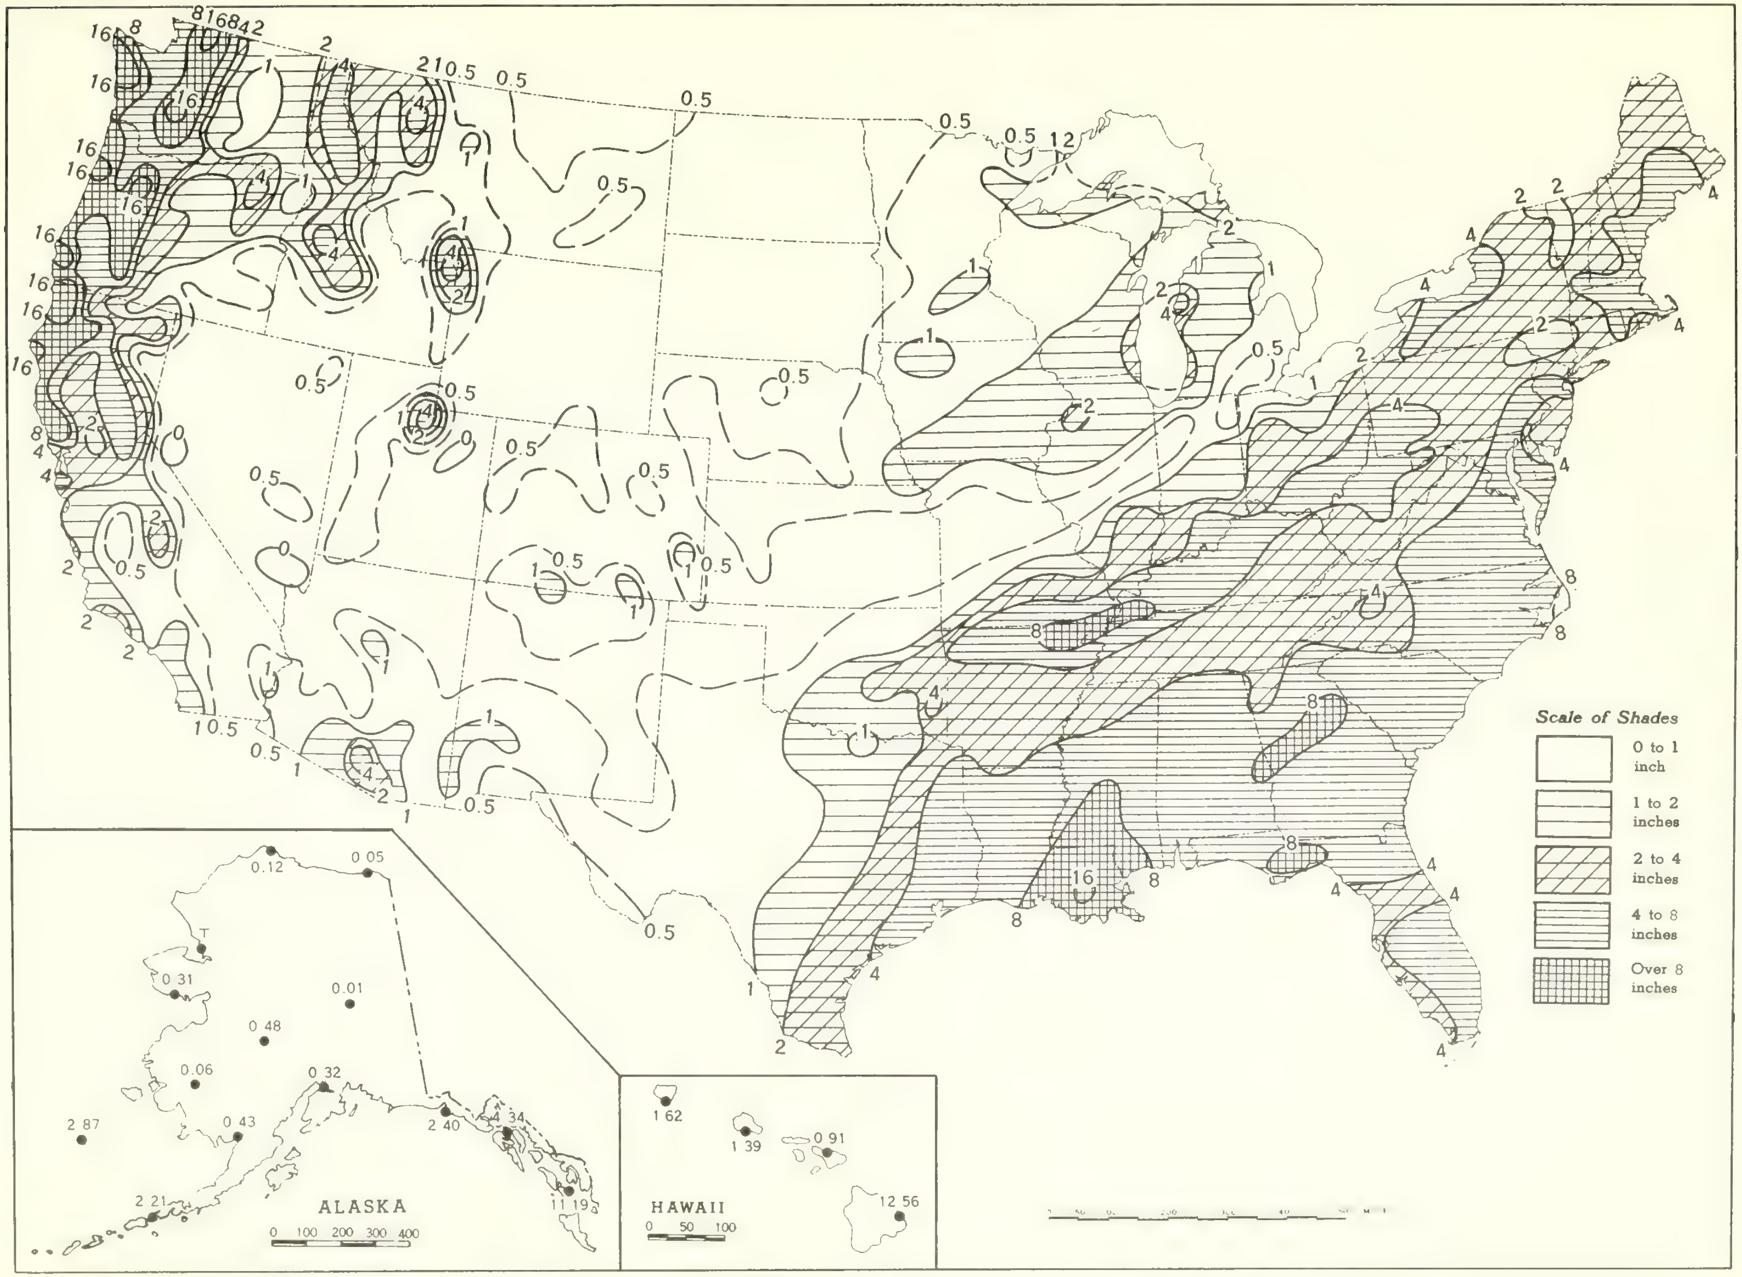
B. Departure of Average Temperature from Normal (°F.), January 1966.



A. Based on reports from over 870 Weather Bureau and cooperative stations. The monthly average is half the sum of the monthly average maximum and monthly average minimum, which are the average of the daily maxima and daily minima, respectively.

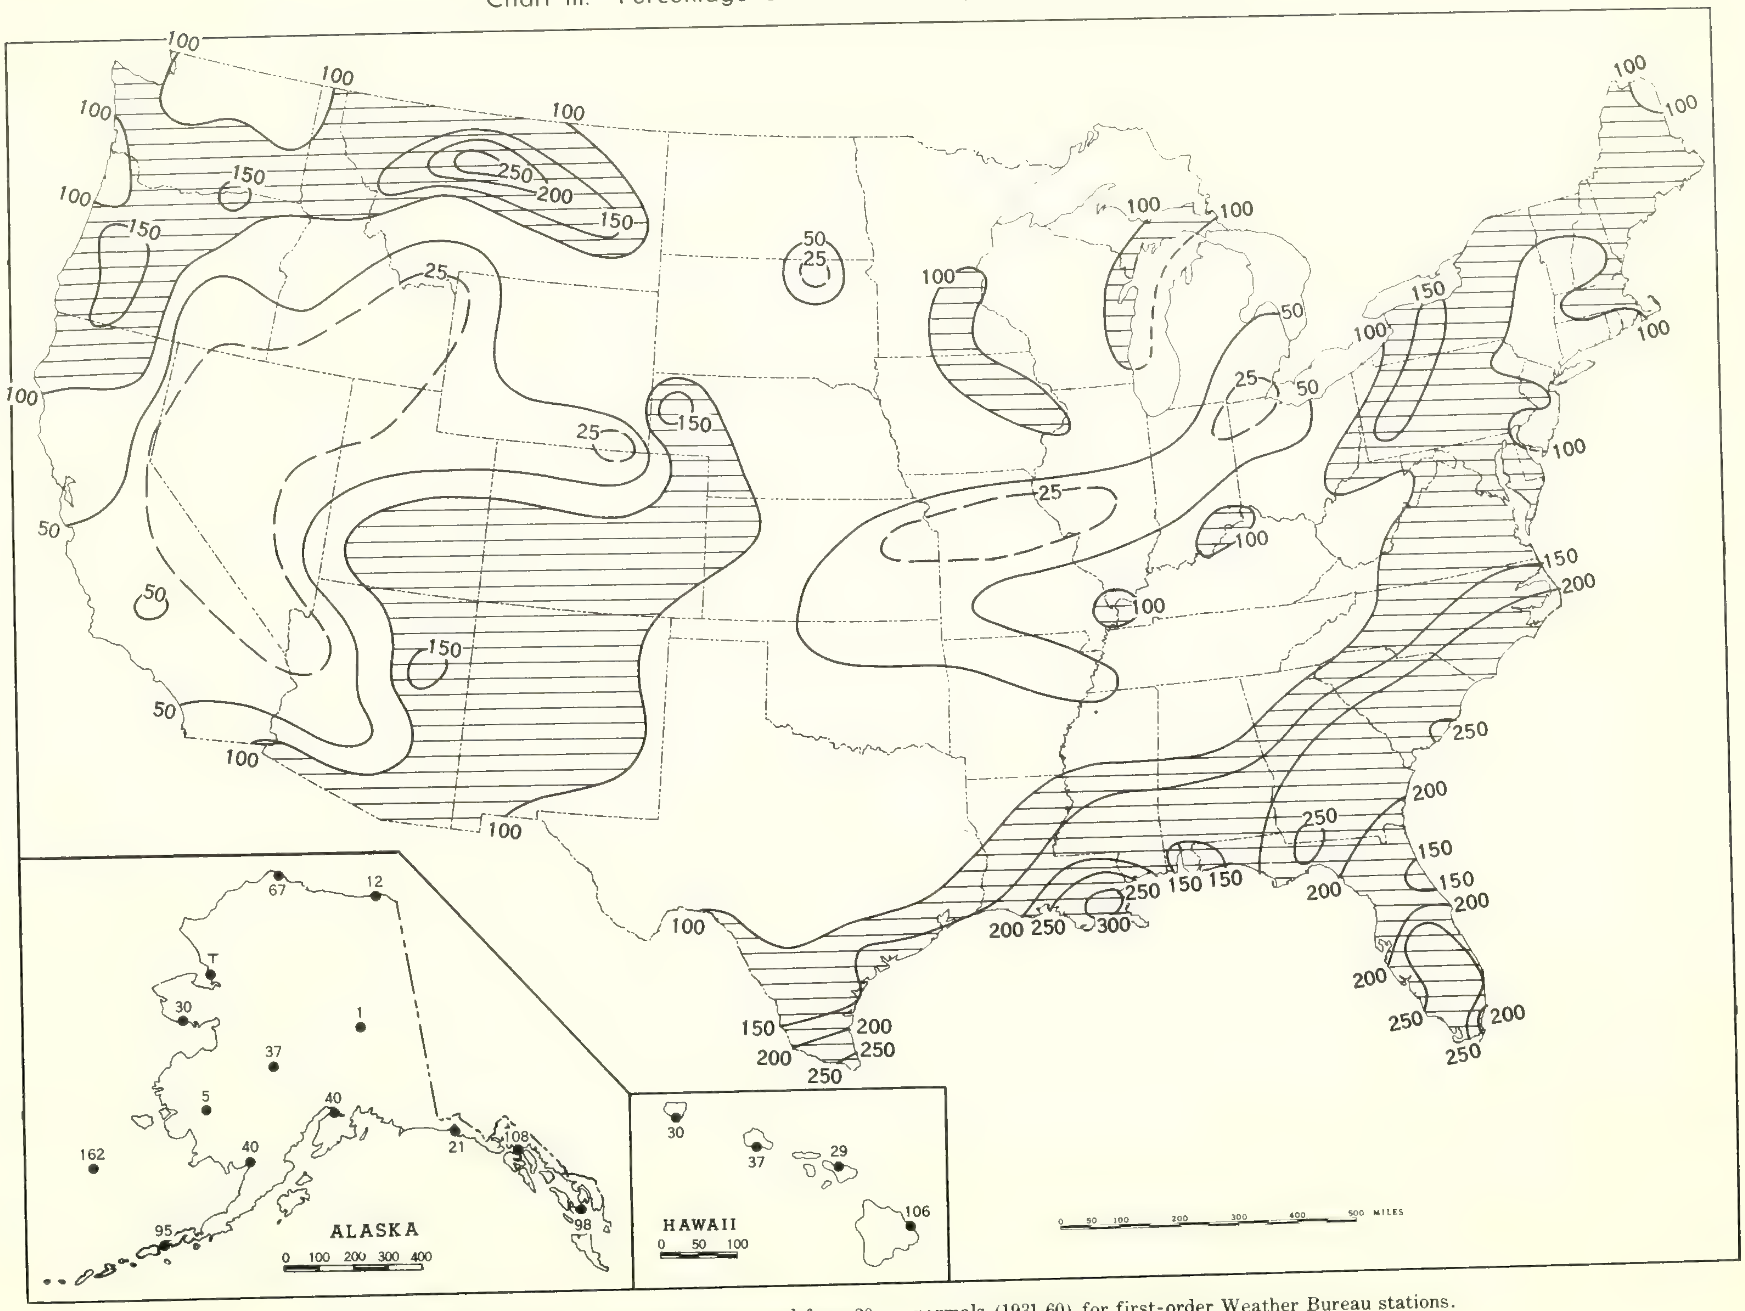
B. Departures from normal are based on the 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart II. Total Precipitation (Inches), January 1966.



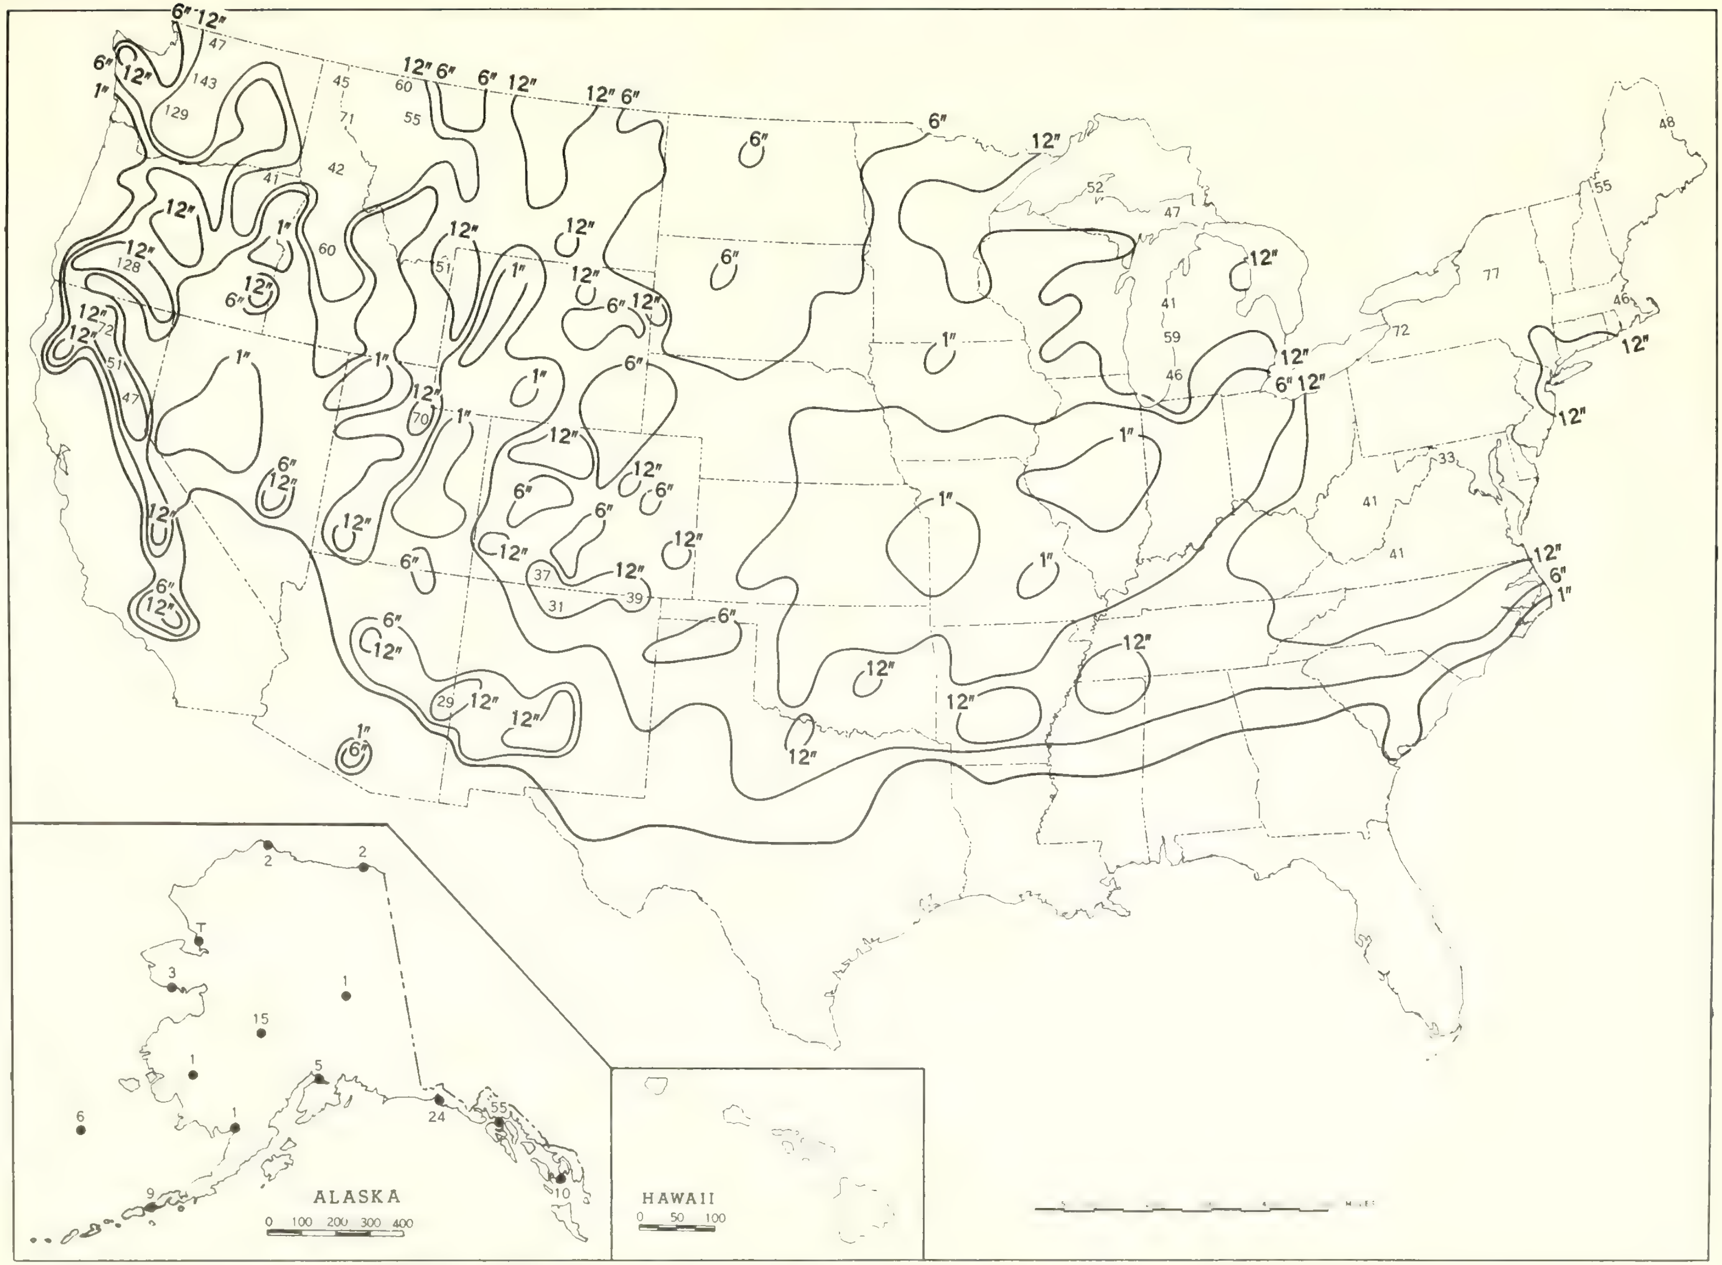
Based on daily precipitation records at about 870 Weather Bureau and cooperative stations.

Chart III. Percentage of Normal Precipitation, January 1966.



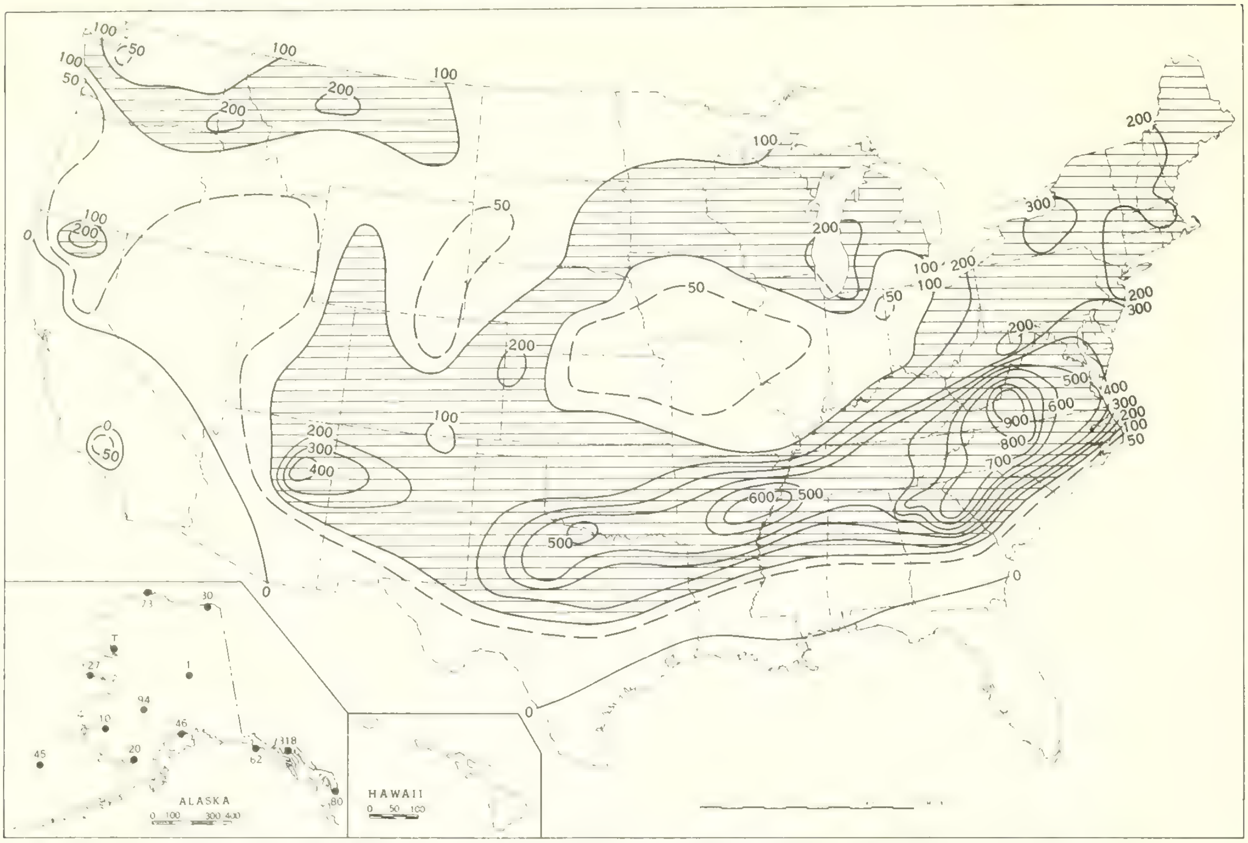
Normal monthly precipitation amounts are computed from 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart IV. Total Snowfall (Inches), January 1966.

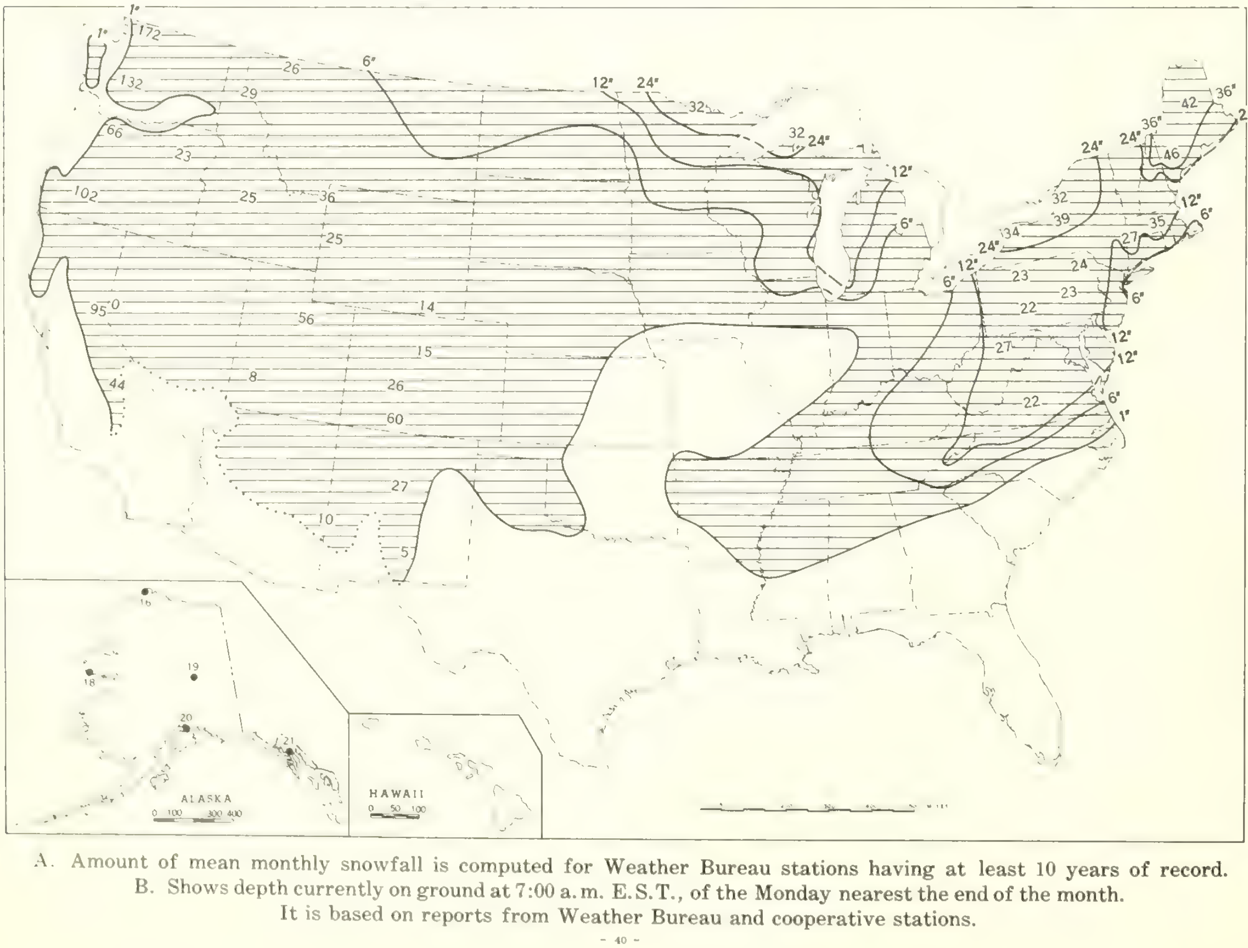


This is the total of unmelted snowfall recorded during the month at Weather Bureau and cooperative stations. This chart and Chart V are published only for the months of November through April although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, January 1966.

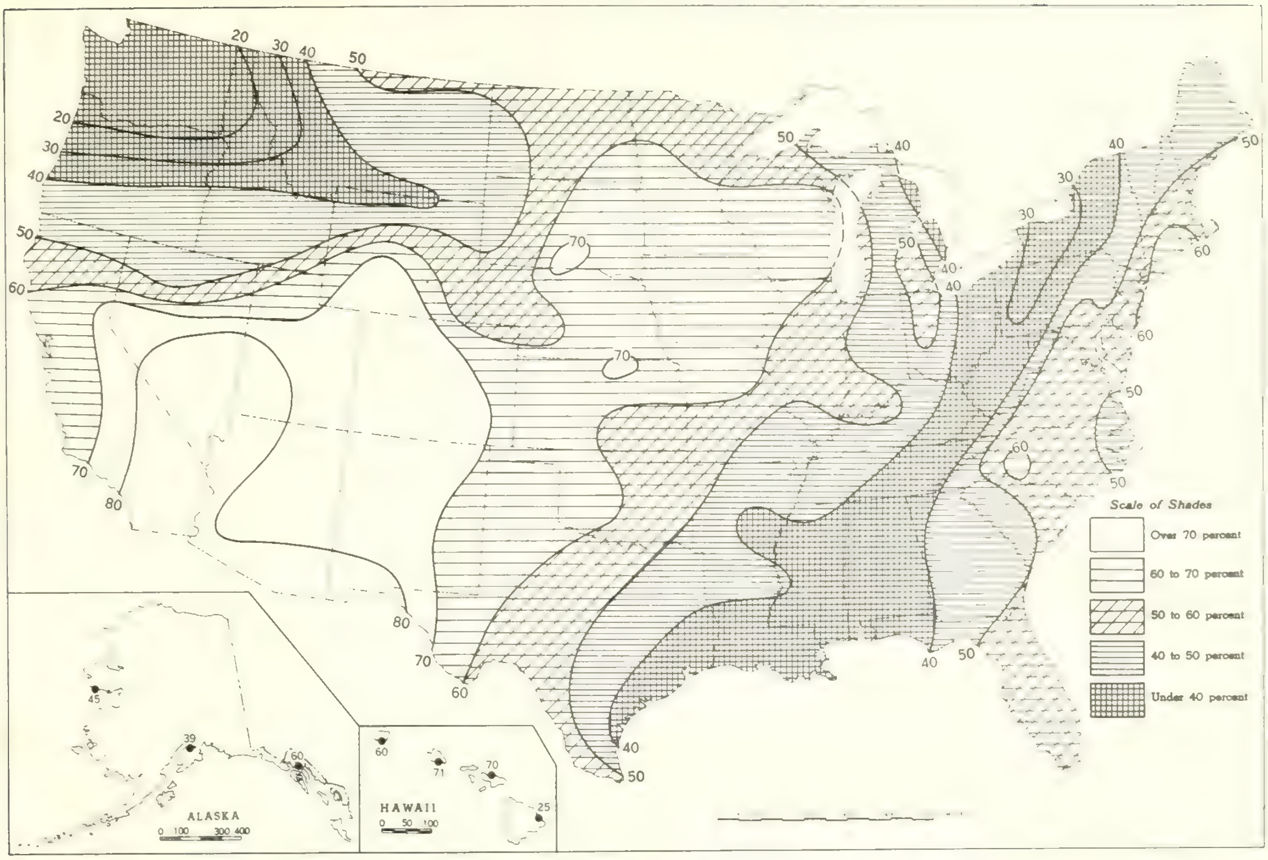


B. Depth of Snow on Ground (Inches), 7:00 a. m. E. S. T., January 31, 1966.

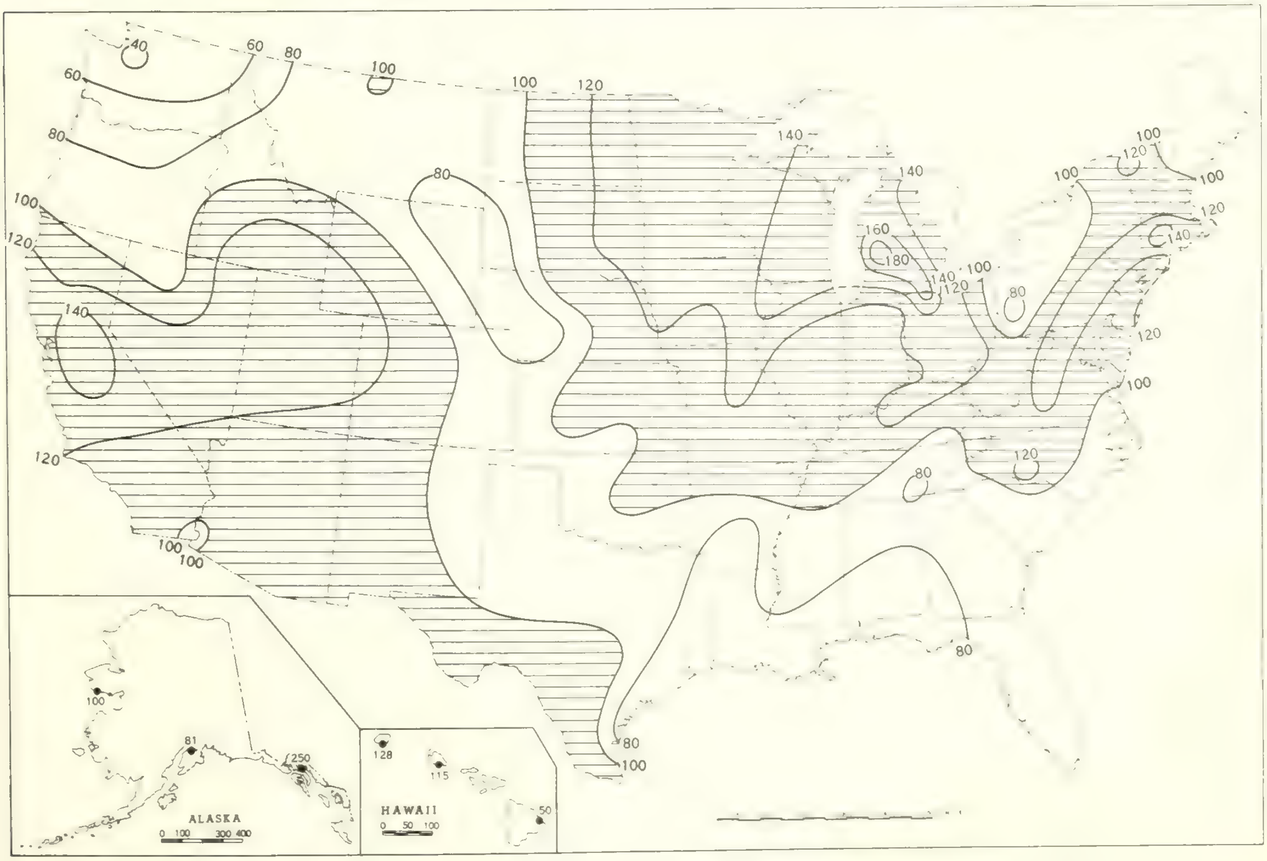


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a. m. E. S. T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, January 1966.

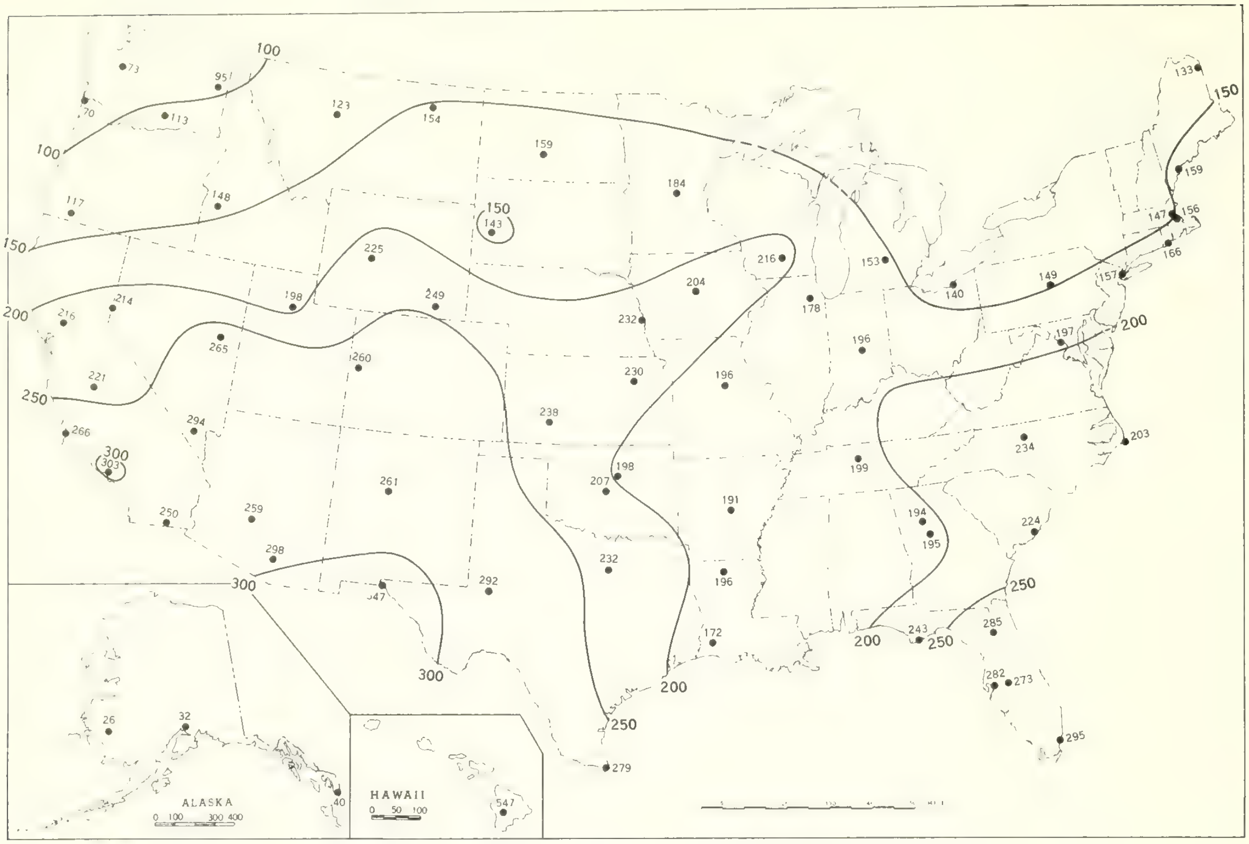


B. Percentage of Mean Monthly Sunshine, January 1966.

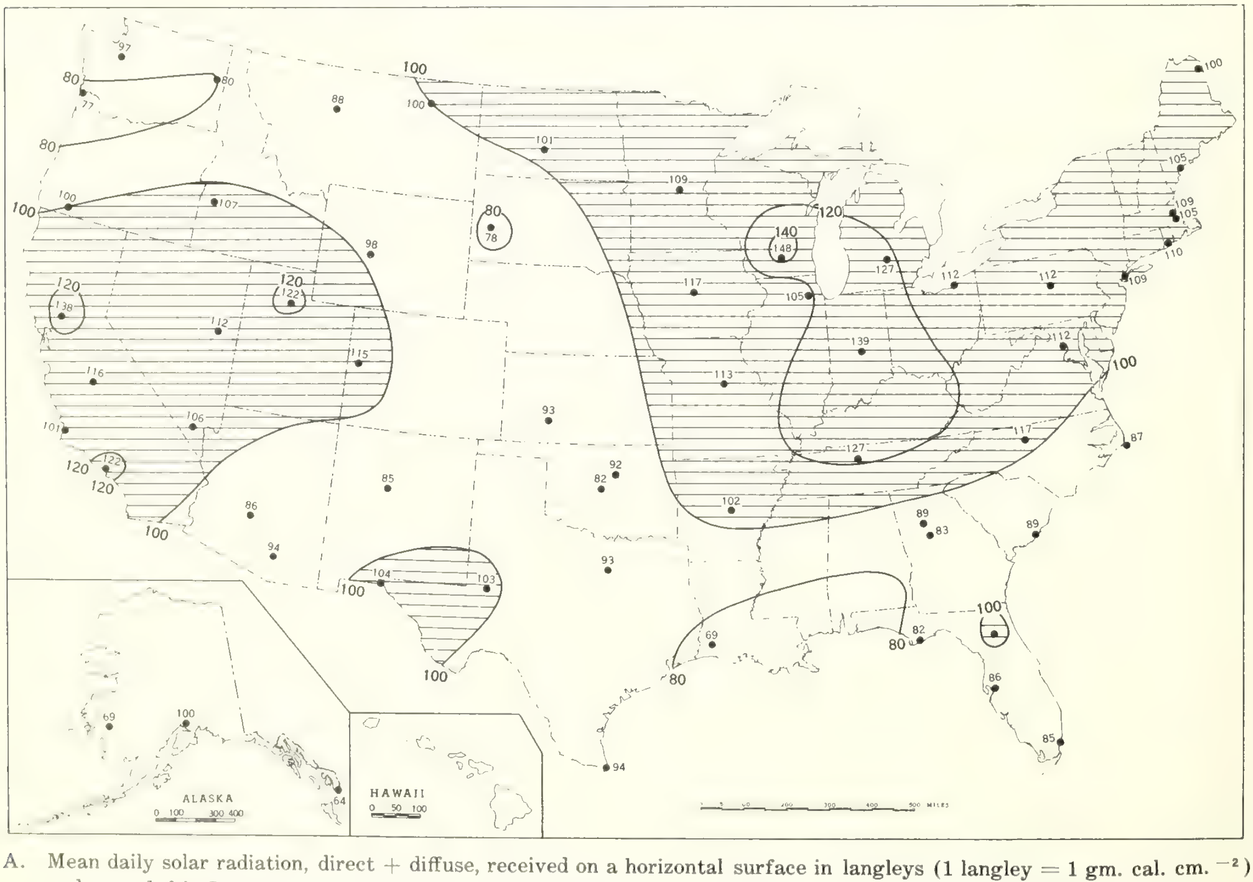


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, January 1966.

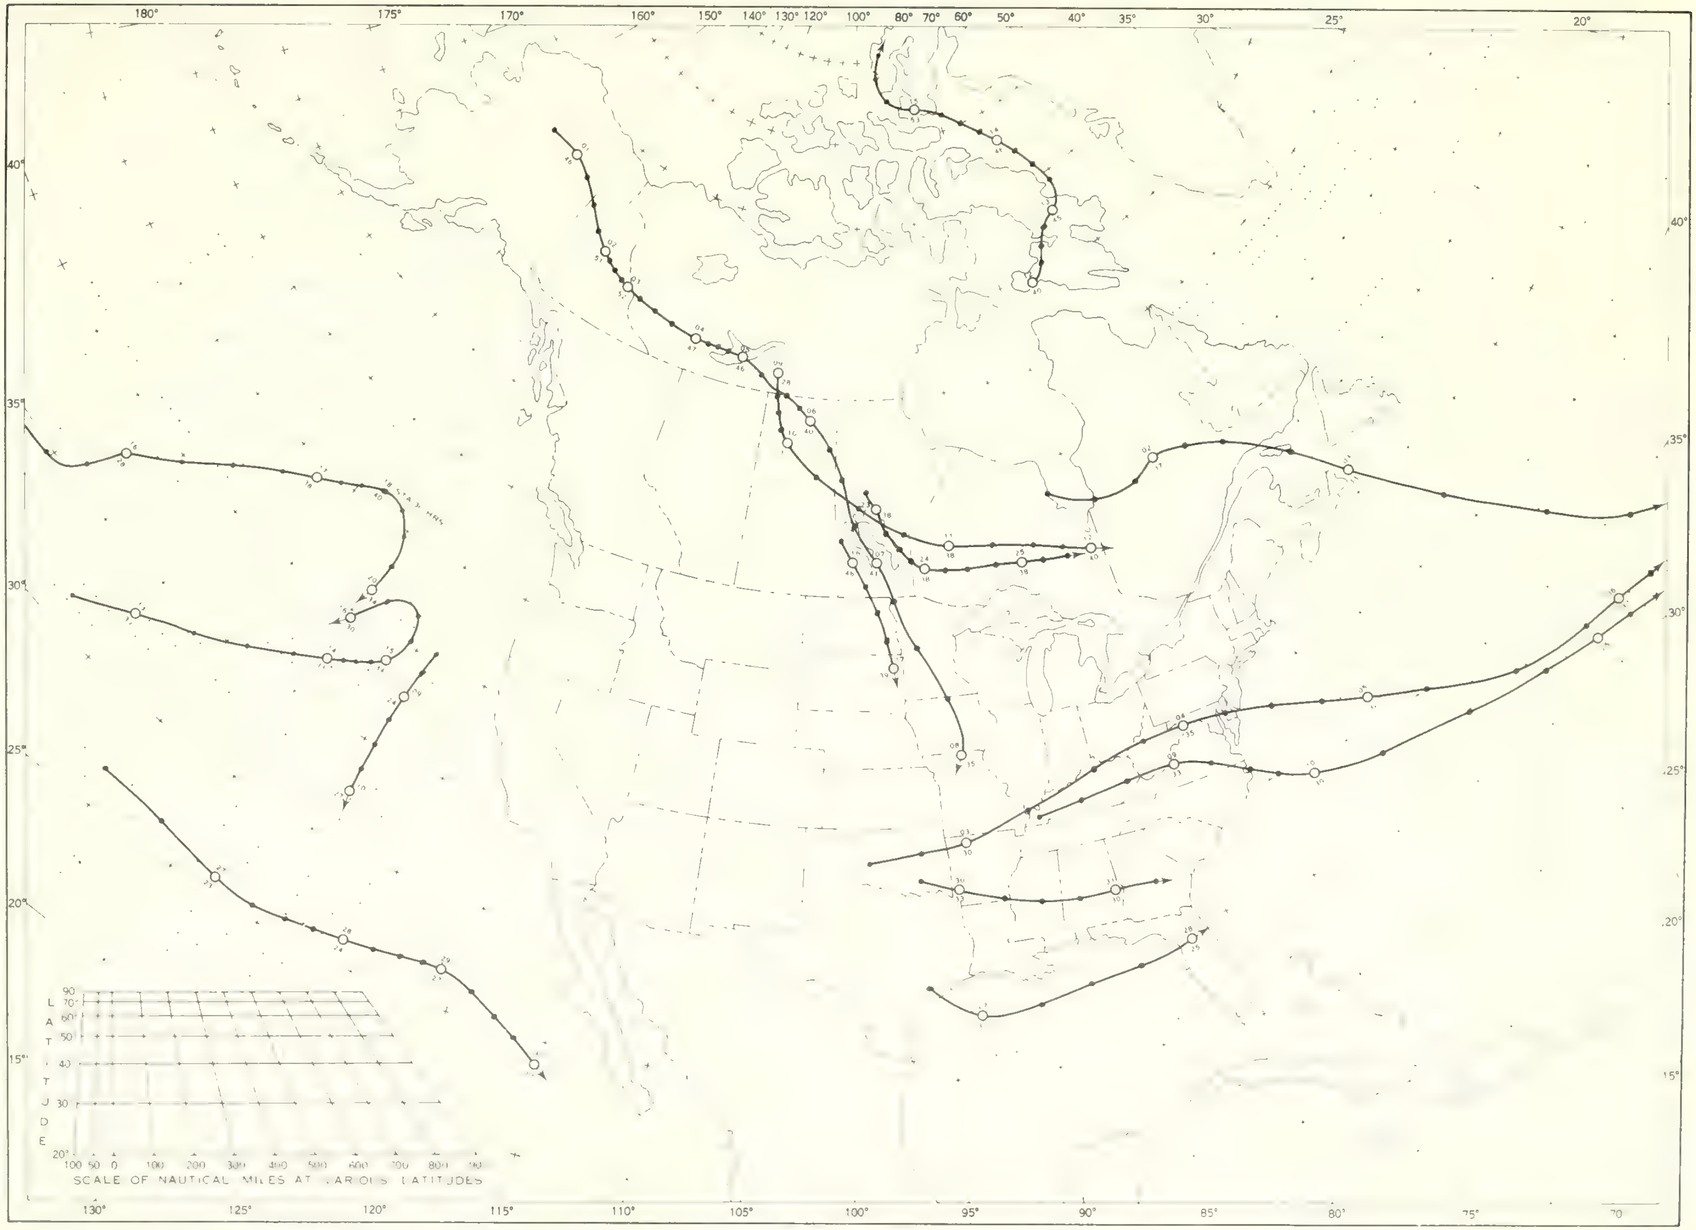


B. Percentage of Mean Daily Solar Radiation, January 1966.



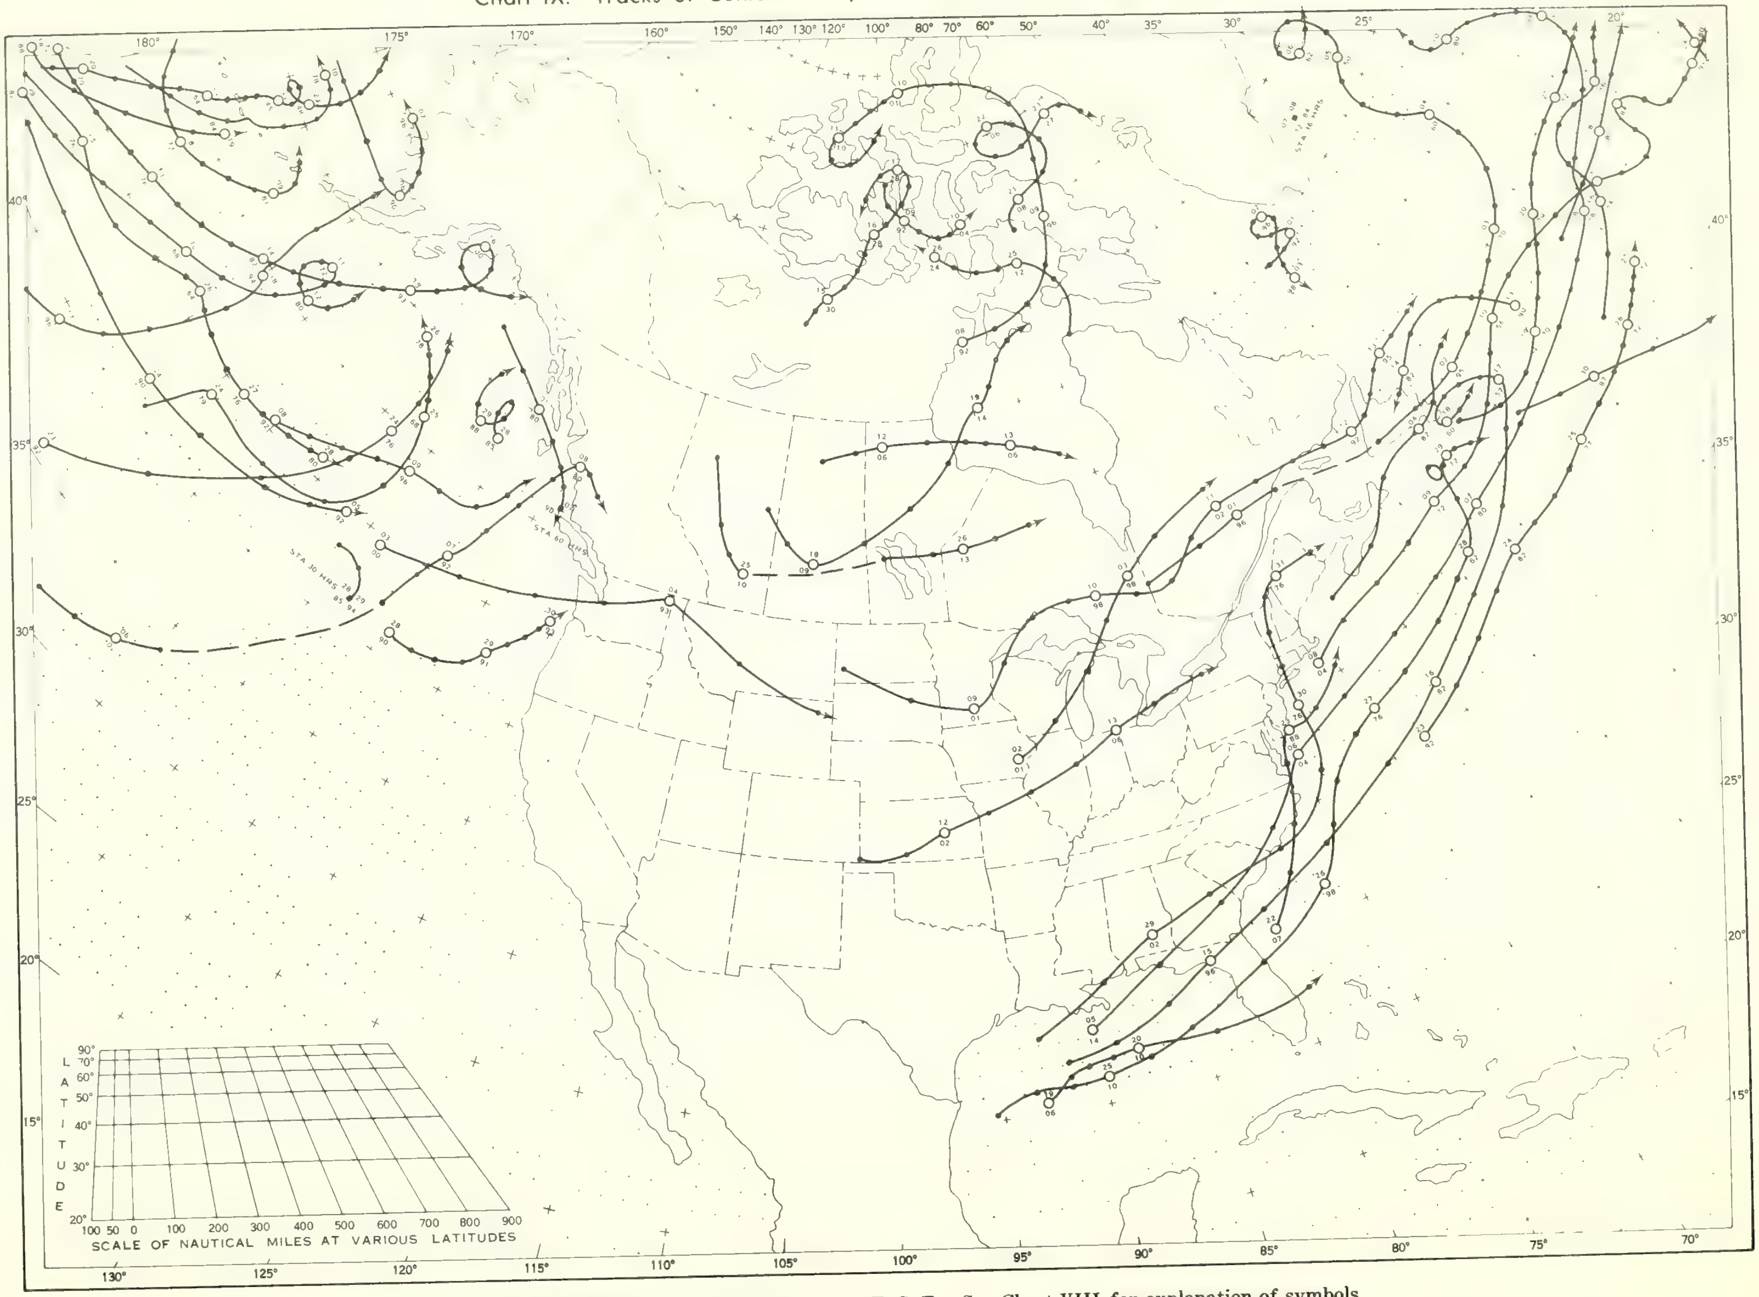
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, January 1966.



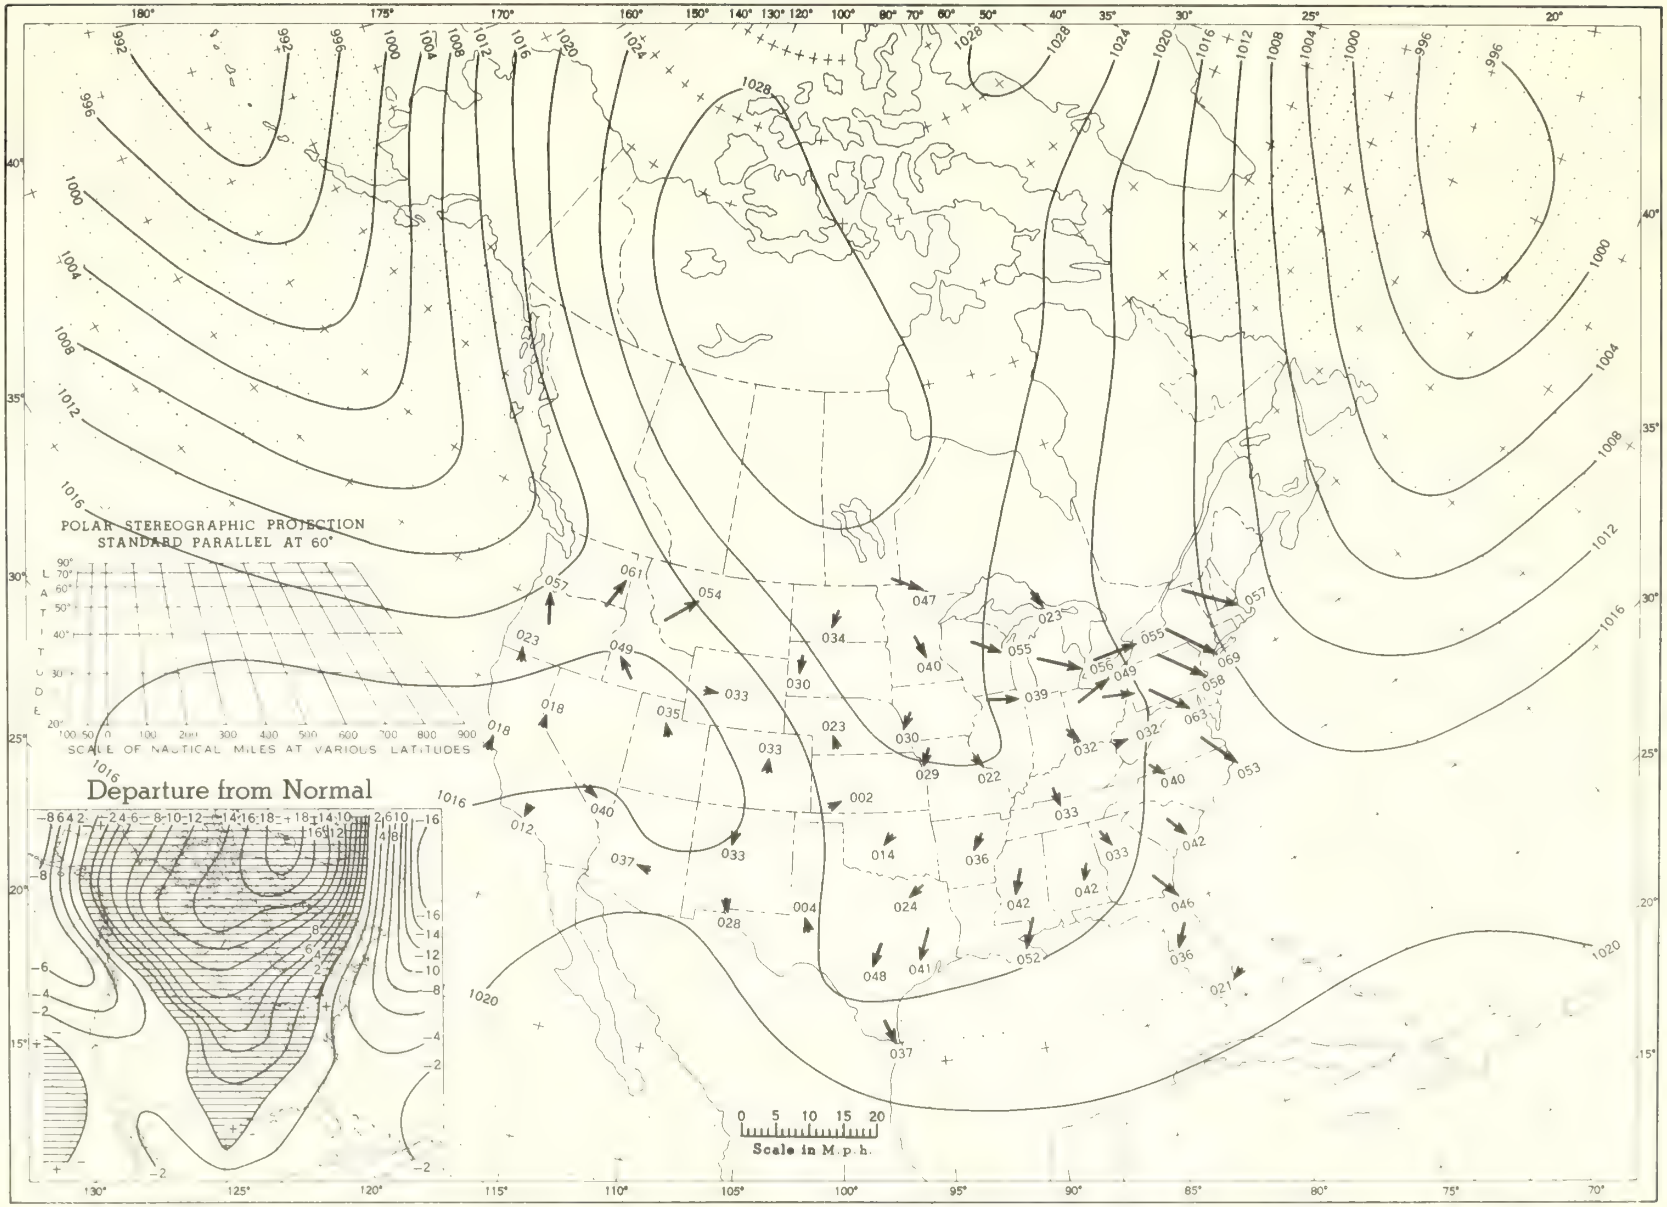
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, January 1966.



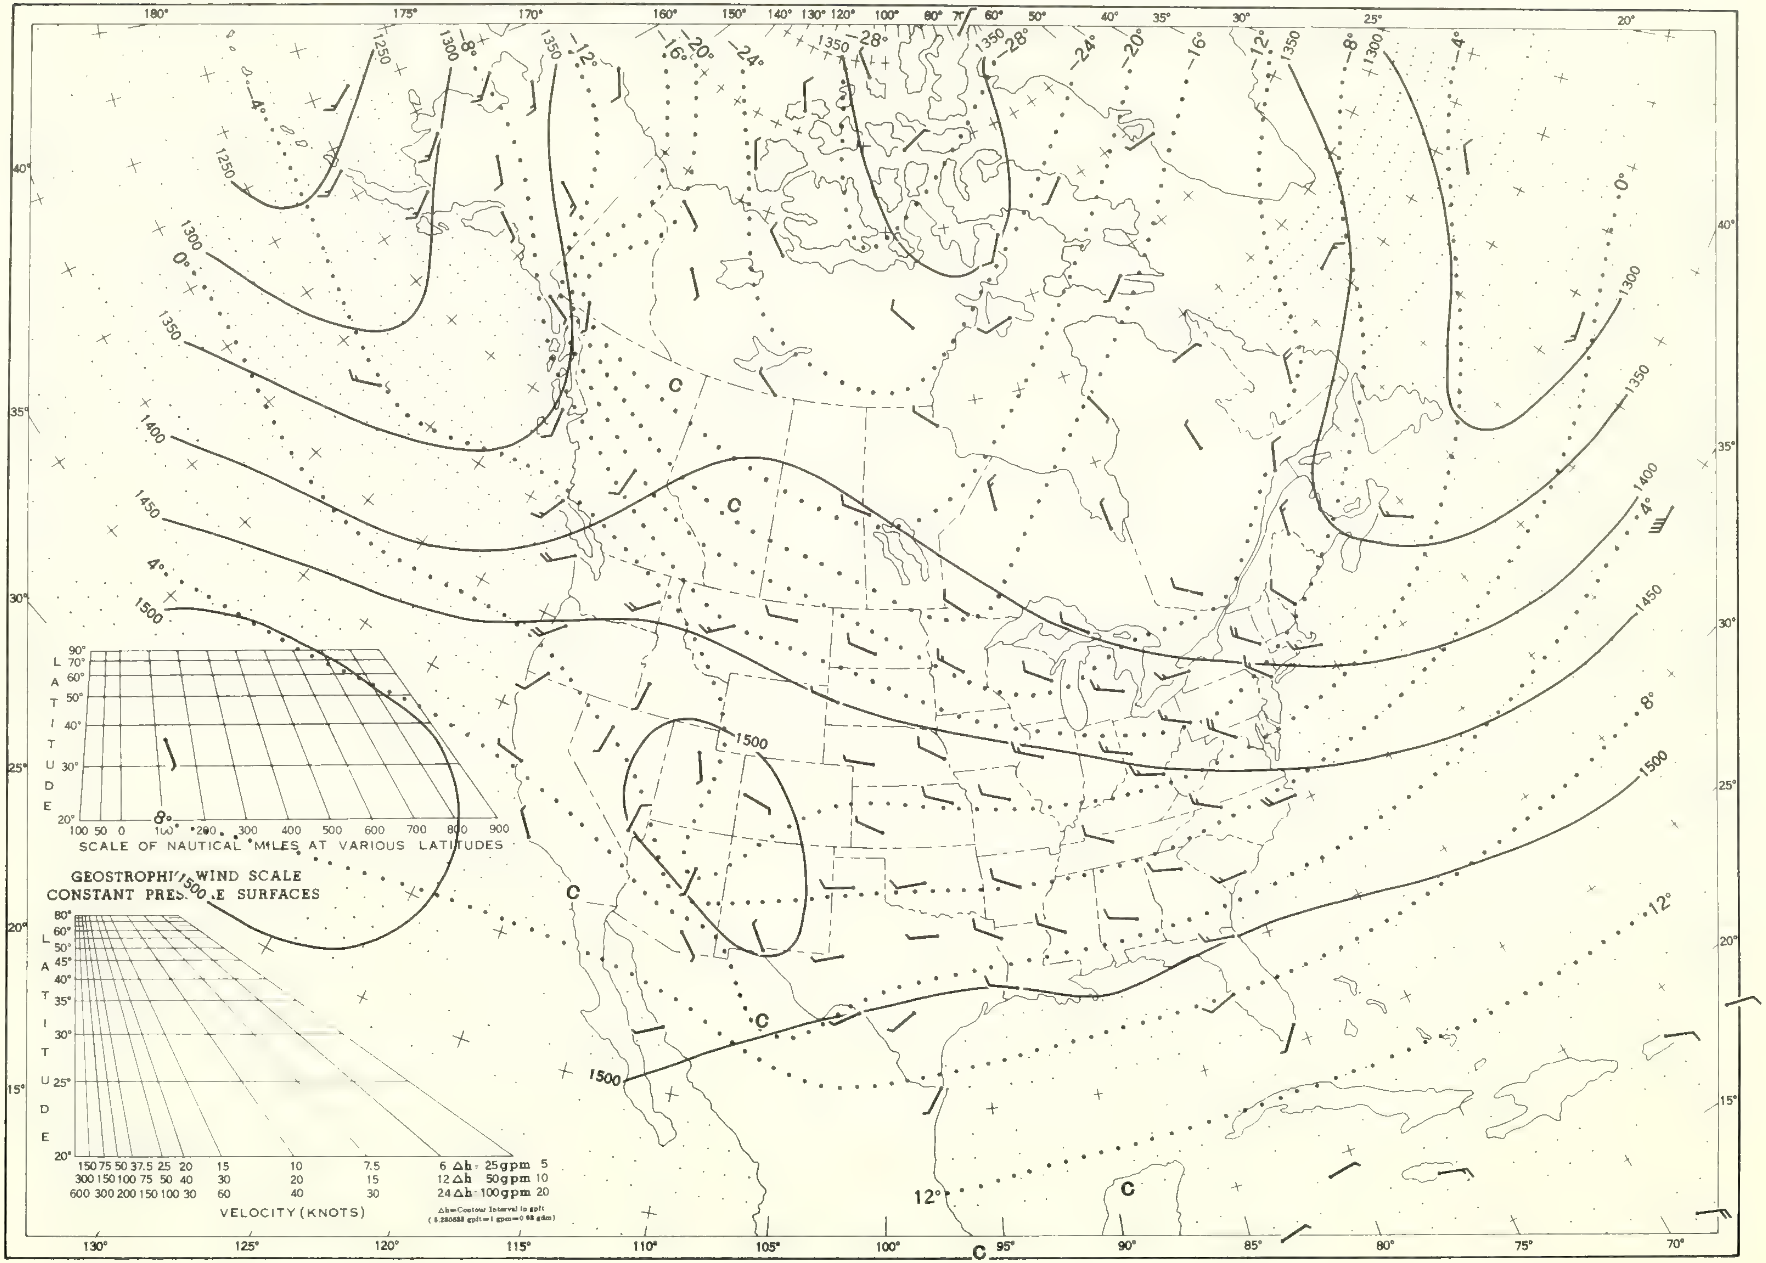
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, January 1966. Inset: Departure of Average Pressure (mb) from Normal, January 1966.



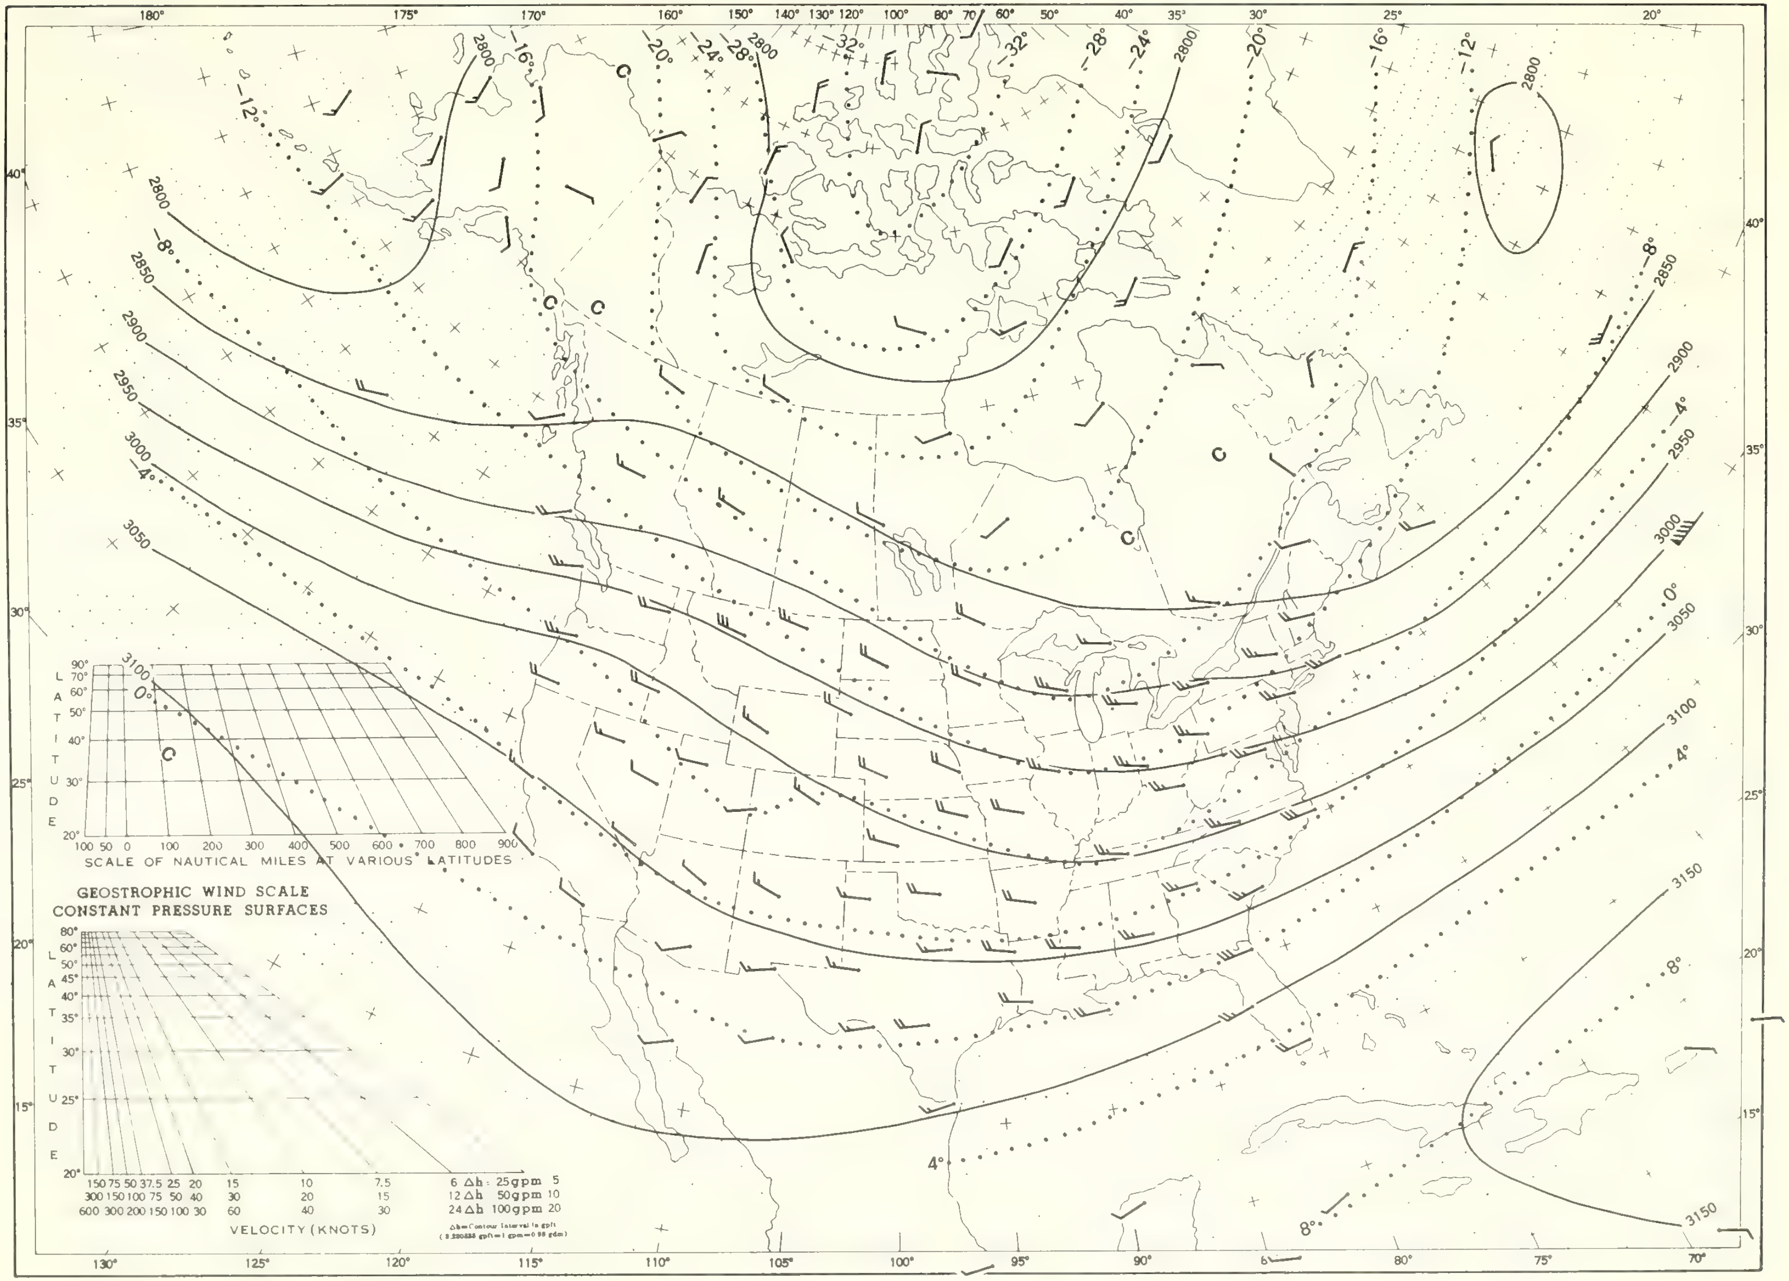
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed—average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, January 1966. Average Height and Temperature, and Resultant Winds.



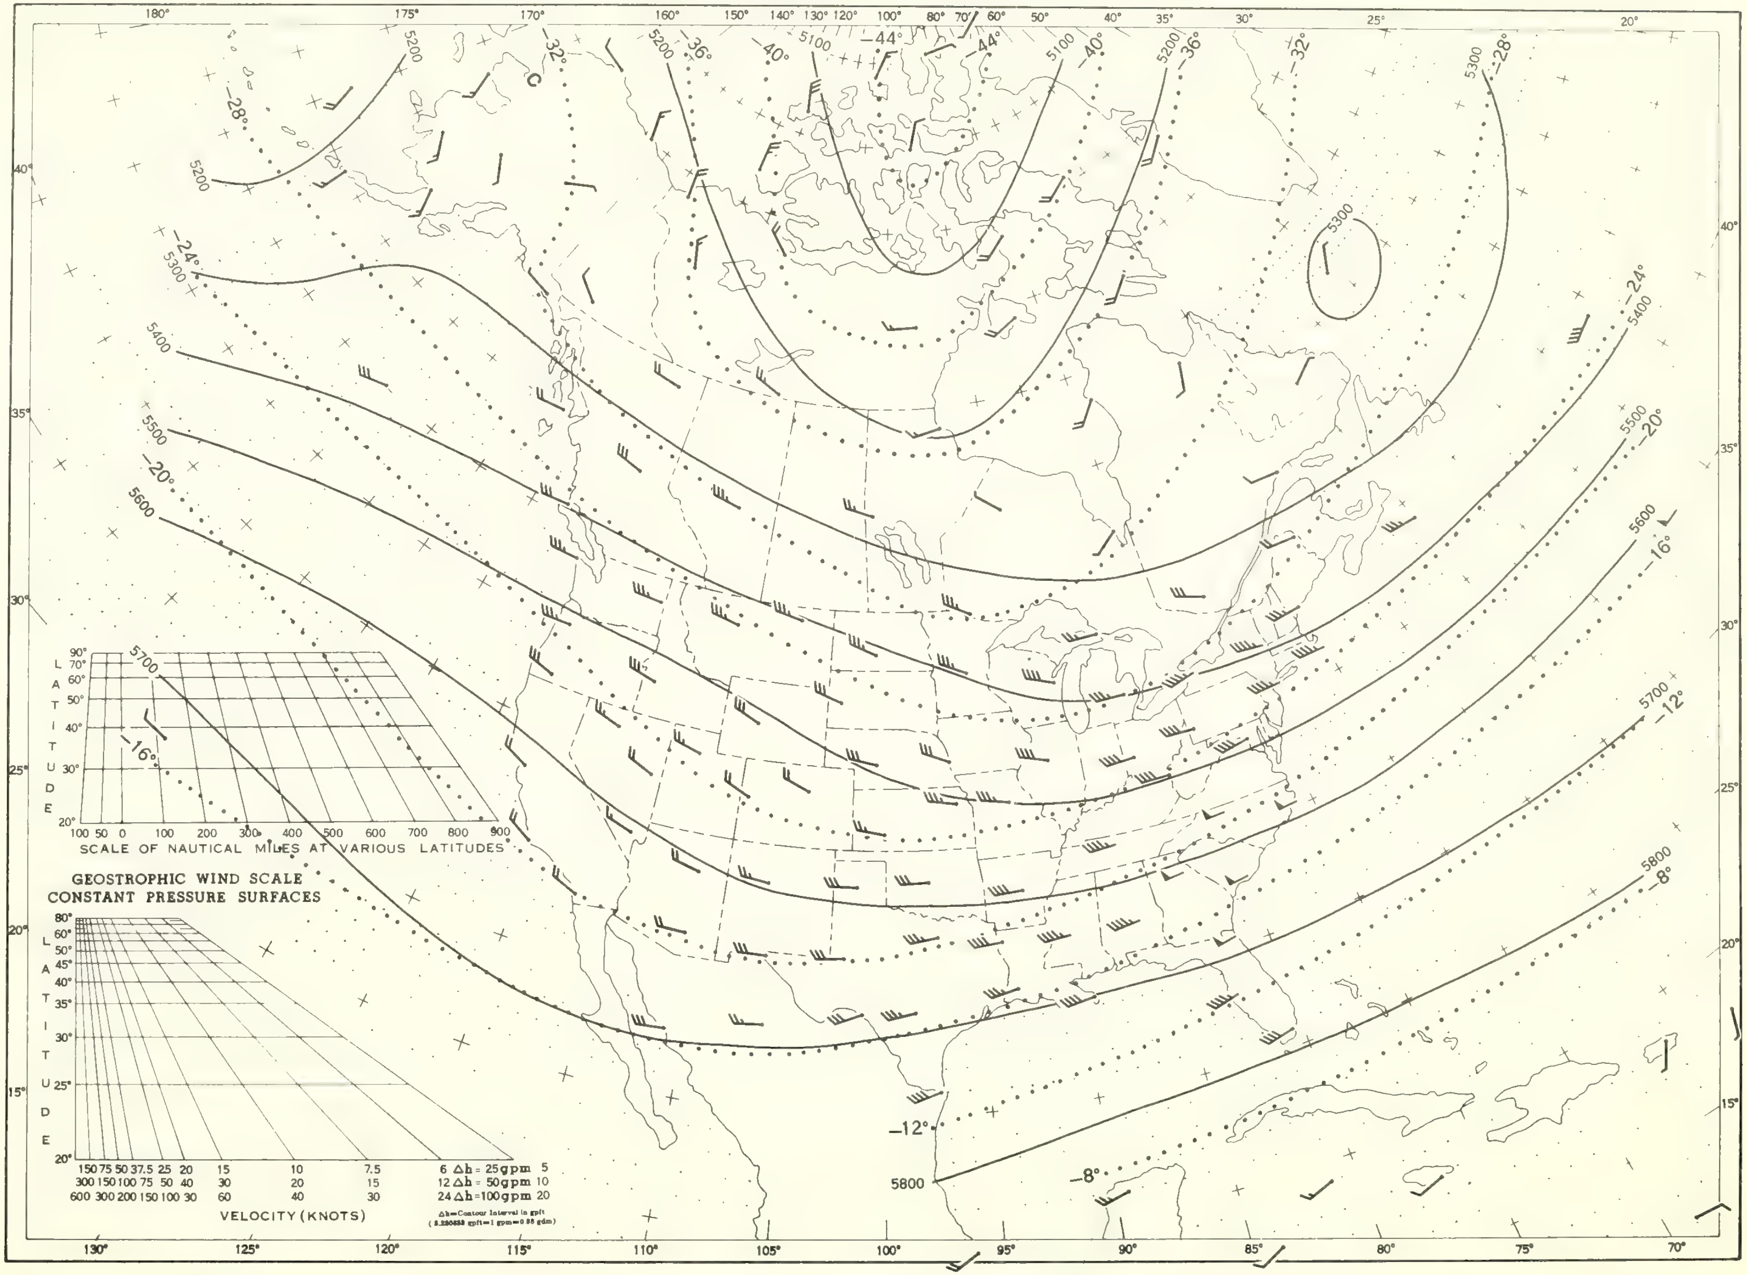
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, January 1966. Average Height and Temperature, and Resultant Winds.



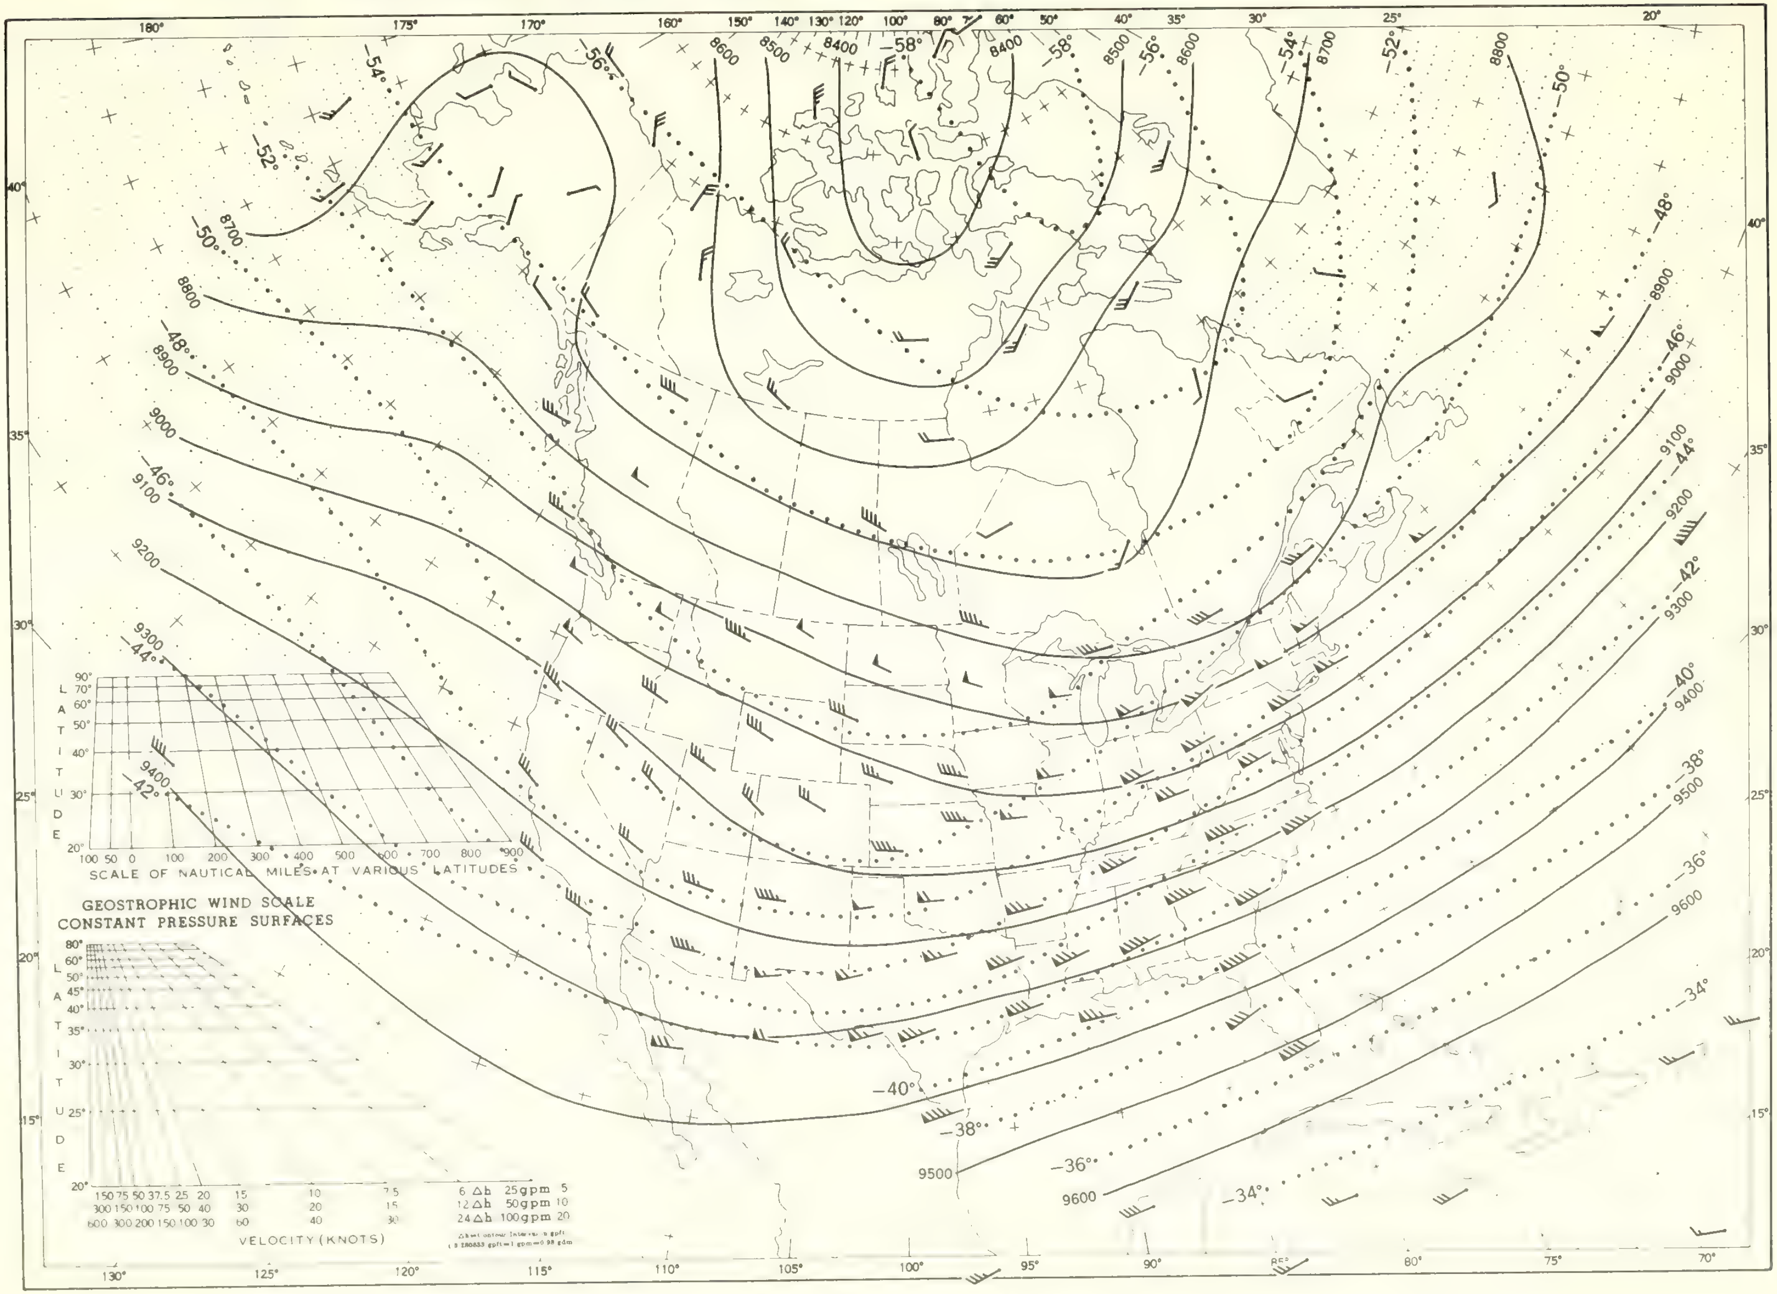
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, January 1966. Average Height and Temperature, and Resultant Winds.



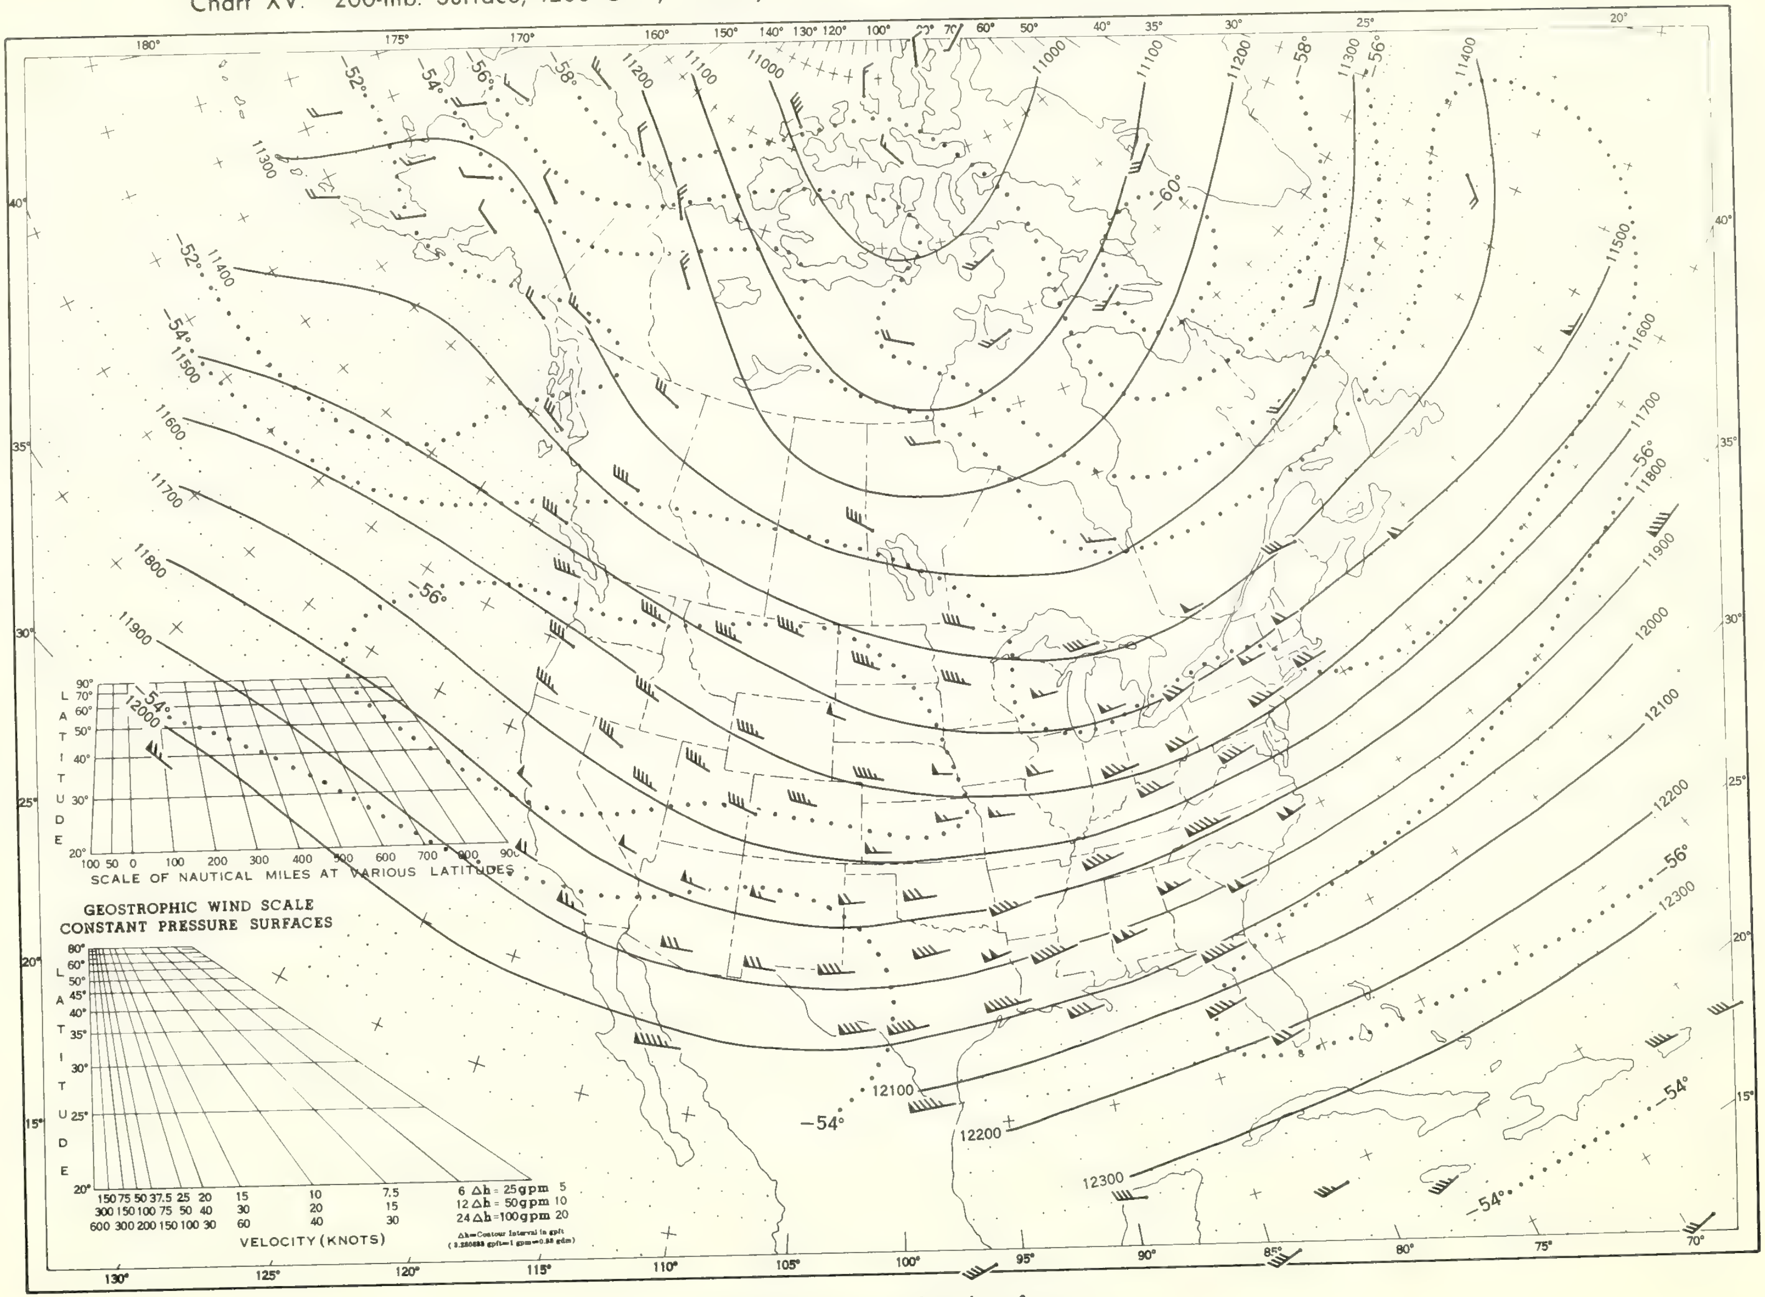
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, January 1966. Average Height and Temperature, and Resultant Winds.



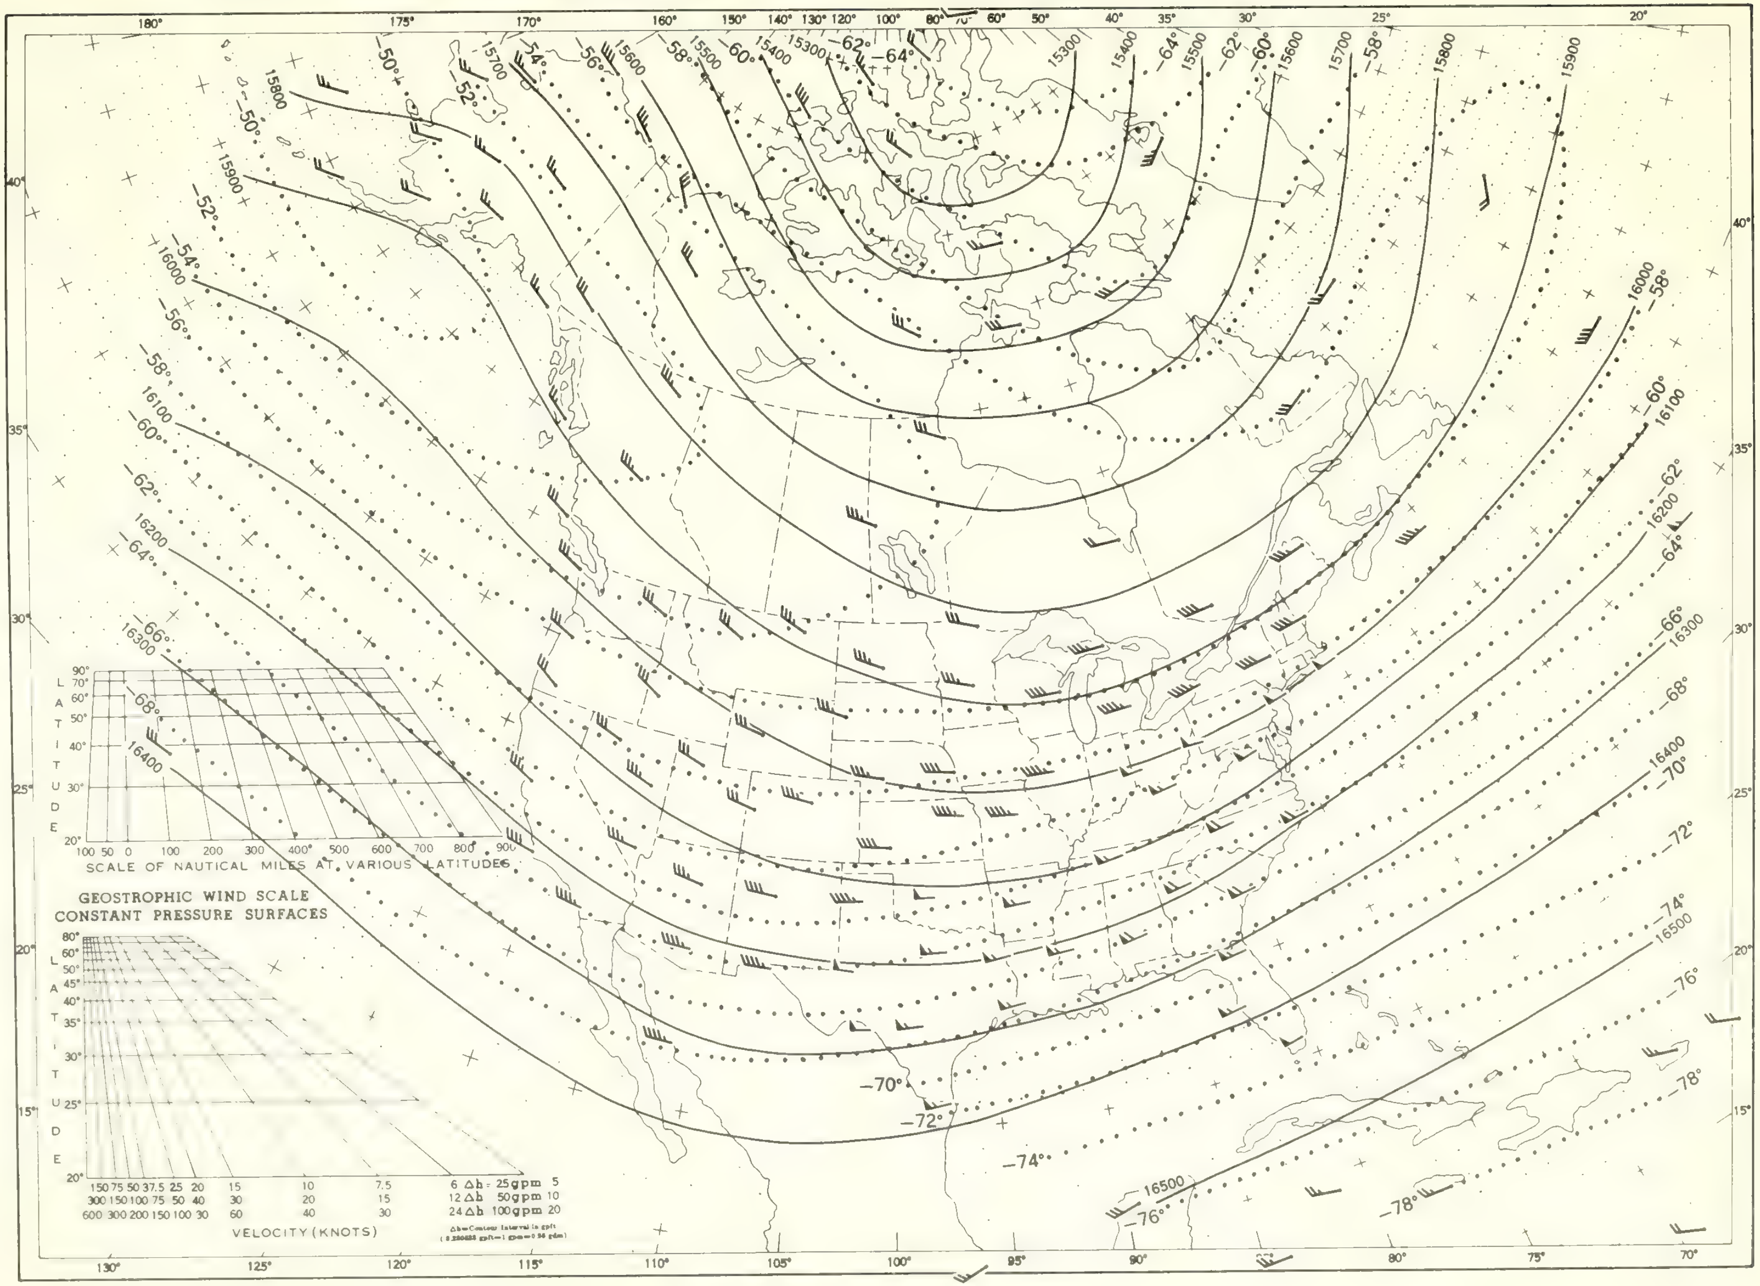
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, January 1966. Average Height and Temperature, and Resultant Winds.



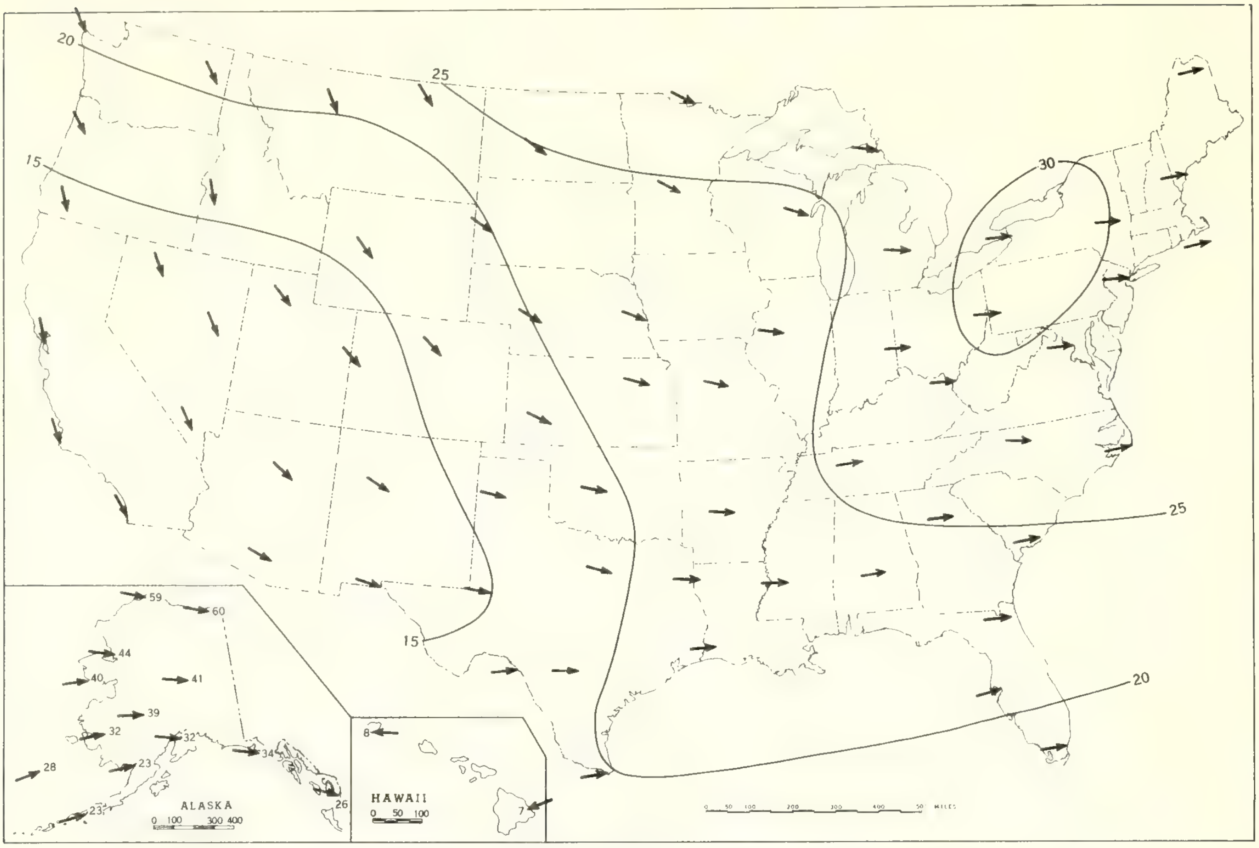
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, January 1966. Average Height and Temperature, and Resultant Winds.

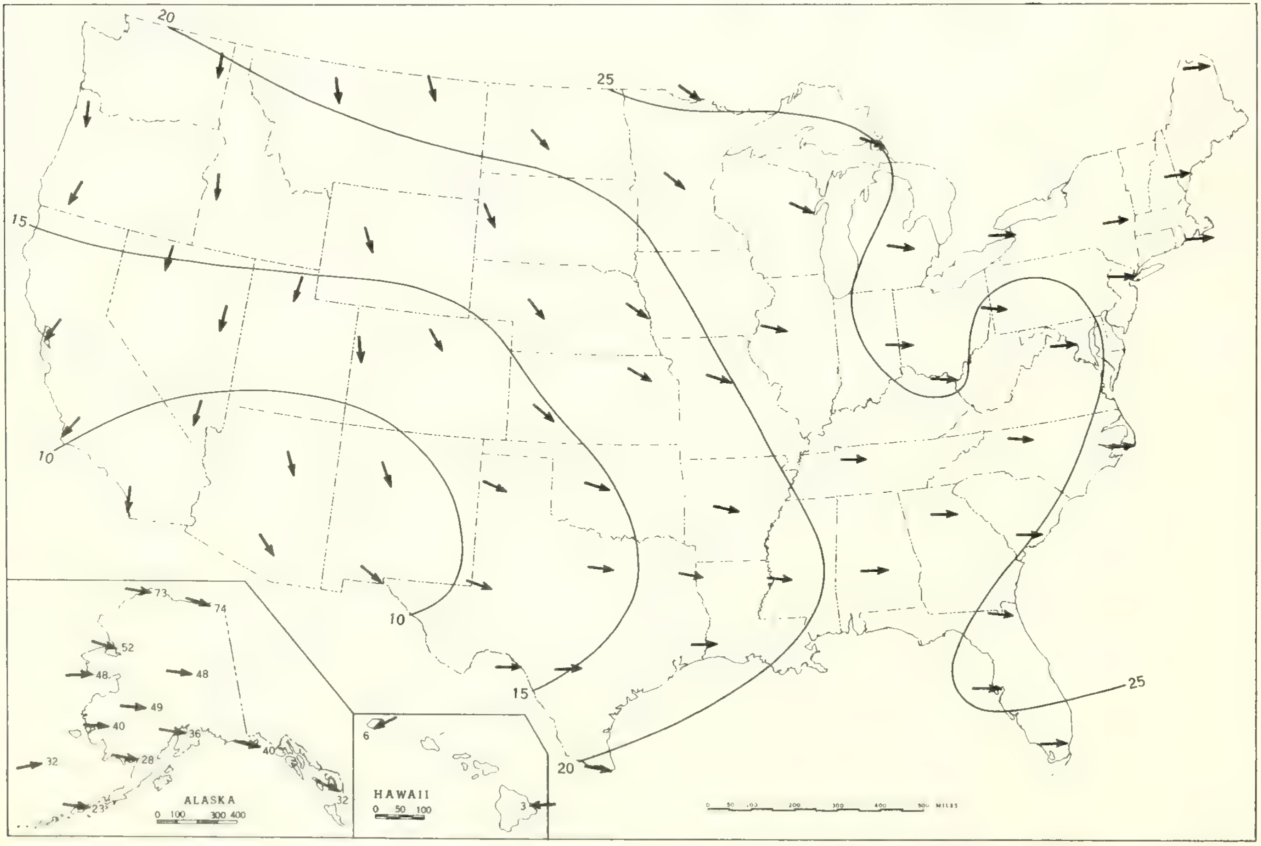


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, January 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, January 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 2 **FEBRUARY 1966**

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Heavy precipitation Southeast second consecutive month.

2. Substantial precipitation in Northeast Drought Area.

3. Wide temperature fluctuations during month.

TEMPERATURE.--Temperatures moderated in February, following a period of extremely cold weather the latter half of January. With alternate warm and cold periods offsetting each other, monthly averages were near normal -- slightly above in a few northern areas and slightly below elsewhere.

The first week of February was unusually cold from the Great Plains eastward, the third consecutive cold week from the Rockies to the Mississippi River, and the fourth consecutive cold week east of the Mississippi. Even though temperatures were slightly higher than during the last week of January, subzero minima were recorded in the Appalachians, northeastern interior, and from the Ohio Valley westward through central and northern Rockies. Freezing covered the 48 states except the southern tips of Florida and Texas and parts of the Pacific coast and Far Southwest. In the Far West, temperatures for the week averaged well above normal in most areas.

The temperature pattern for the second week was the reverse of that for the first week -- cold in the Far West, warm east of the Rockies. The long cold spell in the East was broken. Temperatures rose above freezing in the northern Great Plains and Great Lakes region for the first time in more than a month. At Detroit, Mich., the warmer weather broke the longest spell of subfreezing readings since 1912. An exception to the warm weather in the East was in northern Maine where unseasonable warmth prevailed for the fourth consecutive week.

Temperatures for the third week were below normal everywhere except in parts of the Pacific Northwest and in the east coastal States below New England. The 4-week warm spell in Maine ended. Freezing was general except at a few Gulf and west coast stations, and subzero minima covered most northern areas and much of the Rocky Mountain region. Temperatures rose in most areas the last week, and averaged near normal except several degrees below in the South.

Although temperature extremes were not record-breaking, the month was the second coldest February since 1877 at El Paso, Tex. The third week was one of the coldest such periods on record in northern Minnesota. Frost penetration in Iowa ranged from about 1 to 2 feet in southern portions to about 3 feet in the north.

PRECIPITATION.--Precipitation generally was above normal in the eastern half of the Country and below in the western half. In the Southeast rainfall was unusually heavy for the second consecutive month. Above normal amounts in most of the Northeast helped ease the drought situation there. The heavy rainfall in the Southeast and rain, snowmelt, and occassional icejams in other parts of the eastern half of the Country caused flooding in many areas.

Much above normal precipitation was most extensive in the Southeast. Monthly totals generally exceeded 4 inches from the lower Mississippi Valley to the Atlantic coast and 8 inches in southeastern Louisiana, southern Mississippi, most of Alabama, western Georgia, and northwestern Florida. Baton Rouge, La., measured 14.53 inches and Vicksburg, Miss., 13.69 inches, their greatest February totals. Much of this heavy rainfall fell during the second week when flooding in central and east-central Louisiana forced many families to evacuate their homes and drowned some livestock. Also snowmelt, rainfall, and icejams combined to produce considerable overflow in the upper Midwest, particularly in the upper Mississippi Basin in southeastern Minnesota, southern Wisconsin, east Iowa, northern and western Illinois, and in Missouri. Icejams were blamed for flooding at Norfolk, Nebr., and Warsaw, Ohio. Heavy rains were responsible for flooding in the Ohio River drainage and in many streams that drain into the Gulf, and along the south Atlantic slope.

The Northeast drought area received 2 to over 4 inches of moisture which improved water supplies. Boston, Mass., measured 3.48 inches for February and 8.77 inches (1.51 inches above normal) for the January-February period. Philadelphia, Pa., and Providence, R. I., reported above normal amounts for the first time in 14 to 13 months, respectively.

During the first week precipitation was heavy along the Pacific coast and in an area from southern Missouri through the lower Ohio Valley from a storm that moved out of the lower Rockies.

Much of the South received 4 to 8 inches and the Northeast drought area over 2 inches during the second week. Substantial amounts also fell in the southern Rockies.

Substantial amounts the third week were mostly limited to the South and East. Portions of Mississippi, Alabama, and Georgia received more than 2 inches. Heavy amounts the fourth week were limited mostly to coastal areas.

SNOW.--Snow cover was extensive at the beginning of February. Depths ranged up to 172 inches in the Cascades, 32 inches in northern Michigan, and 46 inches in New England. This cover receded to extreme northern areas east of the Rockies by midmonth, with little change during the remainder of the month. In the Far West snowfall for February was generally below normal, but seasonal snowfall ranged from about 70 to 100 percent of average. At the end of February the mountain snowpack was about twice normal in Arizona and New Mexico, below normal east of the Divide from Montana to southern Colorado, and parts of Wyoming and the Pacific Northwest.

The northeastern blizzard at the end of January left depths generally exceeding a foot and ranging locally up to 3 feet in northwestern New Jersey, much of Pennsylvania, New York State, and New England.

Some moderately heavy falls occurred in the central and southern Rockies during the second week. Snowfall during the last week was heavy in the Cascade Mountains and in a belt extending from central Texas to Maine. Falls ranged up to 10 inches in central Texas.

A coastal storm during the 24th-26th dumped up to about a foot of snow in West Virginia's eastern Panhandle, parts of northern Maryland, the Susquehanna Valley, and other parts of eastern Pennsylvania, and northeastern New Jersey. Falls in the eastern third of New York State were the heaviest of the winter there, ranging from 12 to 20 inches in the Hudson and parts of the Champlain Valley, 4 to 8 inches on Long Island, and lesser amounts elsewhere in the State. In New England falls generally ranged from 8 to 16 inches, mostly over 12 inches except up to 20 inches in some northern sections and tapering off to 5 to 7 inches on the south coast.

Snow fell in many parts of Texas the last week of February, and was quite heavy in some central portions. Austin measured 6 inches on the 22d and 23d, and up to a foot was reported northwest of the city. Dallas and Del Rio reported over 2 inches and San Antonio over 3 inches during the same storm.

SEVERE STORMS.--The principal outbreak of severe storms occurred during the second week. Most of these were associated with two storm systems. The first Low moved up through the Great Plains from the Texas Panhandle region and severe thunderstorms with hail and tornadoes were reported in Oklahoma and Mississippi. The second storm moved northward west of the Appalachians and tornadoes occurred in Georgia, North Carolina, and Virginia. Considerable flooding occurred in the Midwest, parts of the Central Plains, and Southeast.

On the 13th damaging windstorms were widespread in Georgia, with heaviest losses in northeast and south-central sections of the state. The poultry industry in northeastern Georgia suffered heavy losses. Heavy rains also occurred, causing flash floods in many parts of the State. Wind and rain damage totaled well over a million dollars.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

CLIMATOLOGICAL DATA

METRIC UNITS

State and Station	Elevation (ground)	Pressure: Station ⊙	Pressure: Sea level	Temperature: Average maximum	Temperature: Average minimum	Temperature: Average	Temperature: Departure from normal	Temperature: Highest	Date	Temperature: Lowest	Date	No. of days: Max 32.2 °C or above	No. of days: Min. 0 C or lower	Average dew point	Average relative humidity	Precipitation: Total	Precipitation: Departure from normal	Precipitation: Greatest in 24 hours	No of days: 25 mm or more	No of days: With thunderstorms	Snow, Sleet: Total	Snow, Sleet: Maximum depth on ground	Wind: Resultant speed	Wind: Resultant direction	Fastest mile (1.6 kilometers): Speed	Fastest mile: Direction	Fastest mile: Date	No. of days (sunrise to sunset): Clear, 0-3	Partly cloudy, 4-7	Cloudy, 8-10	Sky cover, tenths (sunrise to sunset)	Possible sunshine

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

R	Rain
F	Floods
RF	Rain, floods
FF	Flash flood

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

FEBRUARY 1966

Elmer R. Nelson
Office of Hydrology

The rise in the upper Mississippi River during February was the highest of record for February. The Rock River at Joslin, Ill., exceeded the previous high crest of March 1948. The third highest stage of record occurred on the Mississippi River at Davenport, Iowa, due to an ice-jam. Many streams in the East Gulf of Mexico Drainage reached the highest level since April 1964.

ST. LAWRENCE DRAINAGE

Lake Ontario.--Heavy rains on the 13th, together with snowmelt, produced moderate flooding in the Genesee Basin in New York between the 13th and 16th. Canaseraga Creek crested at Groveland, N. Y., on the 13th, 1.5 feet above flood stage. Black Creek at Churchville, N. Y., went out of its banks on the 14th and continued in flood to the 16th. The crest on the 15th was 0.6 foot above flood stage. The Genessee at Scio, N. Y., was out of its banks on the 13th and 14th. It crested nearly 0.5 foot above flood stage on the 13th.

ATLANTIC SLOPE DRAINAGE

Rainfall on the 13th, ranging from 1.5 to 2.5 inches, produced up to nearly 4 feet of overflow on some New Jersey streams between the 13th and 15th. Light damage was reported along Assunpink Creek and Raritan River. There was minor damage along small streams and at urban locations where storm drainage was unable to cope with rainfall intensities.

Minor flooding occurred along Neshaminy Creek at Langhorne, Pa., and Brandywine Creek at Chadds Ford, Pa., on the 13th and 14th. There was also some minor flooding on Wissahickon and Darby Creeks. This flooding was due to approximately 2 inches of rain on the 13th plus runoff from snowmelt. A temporary bridge on Darby Creek was washed out. Several homes were reported flooded and some road washouts occurred.

Minor flooding occurred on the Monocacy River at Frederick, Md., on the 14th due to snowmelt and 1.25 to 1.50 inches of rain on the 12th and 13th. In the Rappahannock Basin, the Rapidan River rose to bankfull stage at Rapidan, Va., on the 13th. The rainfall in the Rappahannock Basin averaged 1.5 to 2.0 inches during this storm. A snow survey on the 8th indicated an average water equivalent in the snowpack of 2.59 inches in the Potomac Basin and 2.82 inches in the Rappahannock Basin. Warm, moist air on the 10th and 11th caused rapid melting of the snow cover. No damages were reported from the flooding.

Light flooding occurred on the Jackson and lower James Rivers in Virginia from the 13th to the 16th. Stages in the upper James reached approximately three-quarters bankfull. The water equivalent of the snow cover averaged about 3 inches. Mild weather on the 10-11th caused rapid melting of the snow cover. Heavy rainfall (1.35 inches) on the 12-13th caused heavy runoff. Damages were minor and were confined to lowland flooding of farm- and pastureland downstream from Scottsville.

The flooding that occurred on streams in eastern North Carolina beginning on the 14th was due to heavy rain plus snowmelt. There was still much snow on the ground the beginning of the month. The rivers were running near normal level on February 1, but were rising slowly from snowmelt. Sharp rises resulted on all streams from the 1 to 2 inches of rain on the 12th and 13th. The lower Cape Fear River rose to around 4 feet above flood stage. Minor overflow occurred along the Dan River in Virginia and the Neuse River in North Carolina. The precipitation on the 15th (1 to 2 inches) produced stages of a little over 6 feet above flood stage on the lower Cape Fear. The rains on the 24th caused the upper and middle Neuse Rivers to rise a little above flood stage. The lower portion was already 1 to 2 feet out of its banks. Minor flooding resulted on the lower Cape Fear. No damage resulted from the overflows.

Minor overflow of low swamps, that began the latter part of January, on the Lumber River at Lumberton, N. C., subsided on February 6. The heavy rain on the 13th and 14th produced light flooding on the Yadkin River at Elkin, N. C., and 5 feet of overflow at Yadkin College, N. C., on the 15th. The USE Kerr Scott Reservoir and Dam prevented overflow in the Wilkesboro, N. C., area. Before this runoff could subside another heavy rain brought the Yadkin at Yadkin College and the Rocky River at Norwood, N. C., to near bankfull. Flooding followed on the Pee Dee with 5 feet of overflow at Cheraw, S. C., on the 18th and 3 feet of overflow downstream at Peedee, S. C., on the 23d. The Lumber River at Lumberton, N. C., began overflowing again on the 22d. The heavy rain on the 24-25th prolonged the flooding on the Pee Dee. The heavy rain on the 28th caused about 6 feet of flooding on the Pee Dee at Cheraw on March 2. The heaviest damage resulted in the Mt. Airy, N. C., area where the Ararat River and Lovills Creek overflowed considerable amount of business property. At least one family had to leave their home due to the high water. No loss or damage resulted on the other streams.

General rains of 2 to 3 inches on the 12th and 13th caused flooding on the Saluda River at Pelzer, S. C., on the 14th and 15th, and on the Broad River at Gaffney and Blair, S. C., beginning on the 14th. The rain over the upper Broad River was heavier and ranged from 5 to 6 inches. General rains of up to 2 inches fell again over the middle and upper reaches of the Santee on the 16-17th. The Broad River crested more than 7 feet above flood stage at Blair, S. C., on the 15th, flooding some pastureland. The Congaree at Columbia, S. C., crested 2 feet under flood stage on the 15th. Considerable flooding occurred below Columbia over low-lying crop and pastureland. The Wateree at Camden, S. C., crested about 6 feet below flood stage on the 19th. Some flooding occurred below Camden, principally in wooded swamplands. The heaviest losses occurred along the Congaree below Columbia and along the Wateree below Camden. There was serious disruption of lumbering operations along both rivers.

Minor flooding occurred along the Ogeechee and lower Savannah Rivers in Georgia during the latter part of February. Minor damages resulted.

Light flooding was in progress on the Altamaha at Charlotte, Ga., and on the Satilla at Atkinson, Ga., in the beginning of the month. The Altamaha receded within its banks on February 1 and went out of its banks again on the 21st. It crested 6.2 feet above flood stage on the 26th and was still in flood at the end of the month. The Satilla River continued in flood at Atkinson, Ga., until the 12th. Another rise brought the Satilla above flood stage again on the 24th and it was still out of its banks at the end of the month. The Oconee River at Milledgeville, Ga., reached bankfull stage on the 14th. It again reached flood stage on the 16th, cresting 6.7 feet above flood stage on the 17th. It was back within its banks on the 18th. In the reach below, the Oconee exceeded flood stage by 2.5 feet at Dublin, Ga., on the 21st and at Mt. Vernon, Ga., by 2.7 feet on the 23d. The Ocmulgee River went above flood stage on the 13th at Macon, Ga., and was still in flood at Lumber City, Ga., at the end of the month.

EAST GULF OF MEXICO DRAINAGE

Heavy rain on the 12-13th caused flooding on the Chattahoochee and Flint Rivers in Georgia and on the Apalachicola River in Florida between the 14th and the end of the month. The rainfall exceeded 4 inches, except in the Apalachicola and extreme lower portion of the Chattahoochee and Flint Rivers where it exceeded 3 inches. Totals in excess of 5 inches occurred in the headwater area of the Chattahoochee River and over a small area from Goat Rock Dam to Woodbury, Ga. Additional rain of 2 to 3 inches occurred over the upper and middle streams with near 1 inch totals in the lower portion. The most important flooding occurred along the Flint River at Albany, Ga., where flood stage was exceeded by 10 feet. The Apalachicola River rose to more than 8 feet above flood stage at Blountstown, Fla. The total losses are estimated to exceed $1/2 million.

General rains (6 to 9 inches) between the 10th and 16th resulted in moderate flooding along the Alabama River and tributaries beginning on the 13th. The main stem of the Alabama River at Claiborne, Ala., continued through March 2. On most streams, the water reached the highest level since April 1964. The heaviest rain occurred on the 13th with amounts from 2 to 4 inches, falling in less than 24 hours. A few stations in northern Georgia recorded more than 4 inches. The damages were mostly agricultural and will total close to $1 million.

Rains averaging about 2.25 inches over the headwaters of the Warrior and Tombigbee Rivers in Alabama between the 10th and 16th, resulted in minor to moderate flooding. The heaviest rain occurred on the 10th, 12th, and 15th. Damage was not too extensive. However, stages were near the level at which extensive damage begins. Several hundred acres of farmland and timberland were inundated. Grazing areas were inundated and covered with silt. There was some damage to highways and bridge abutments.

Heavy rain between the 10th and 17th caused moderate flooding in the Pascagoula and Pearl River Basins in Mississippi. The heaviest rain occurred in the lower Pearl, Bogue Chitto, and Leaf Rivers. Flood damage was limited mostly to stoppage of construction on highway and levee projects in the Jackson, Miss., area and to agriculture. The heaviest damage occurred along the Pearl River where the total damages equalled nearly $3/4 million.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Heavy rainfall of 1 to 2 inches occurred over the Upper Mississippi Basin on February 8-9. The heaviest rainfall occurred in southeastern Minnesota, northeastern Iowa, and southwestern Wisconsin. This rainfall was equivalent to a normal February's total for most areas. Daily temperatures were as much as 25° or more above normal before and during this storm. Excessive runoff from snowmelt and rain produced flooding on streams in southeastern Minnesota, eastern Iowa, and southern Wisconsin. The normal flow was complicated by icejams. The warm temperatures during the period from the 7th to the 12th extended into the headwaters in Minnesota and Wisconsin, melting the 6-inch average snow cover. The communities in the Kickapoo River Valley in Wisconsin were hard hit. The Baraboo River which empties into the Wisconsin River, downstream from Portage, Wis., suffered serious flooding due to icejams at and near the cities of Reedsburg, Rock Springs, and Baraboo.

The Turkey River at Garber, Iowa, crested nearly 8 feet above flood stage on the 9th. This was 1.2 feet below the March 1965 crest and 3.3 feet below the record 28.06 feet crest of February 1922. The East Branch Pecatonica at Blanchardville, Wis., crested 3 feet above flood stage on the 9th. This was nearly 1 foot lower than in March 1965. The Pecatonica River at Darlington, Wis., crested nearly 5 feet above flood stage; this was more than 4 feet lower last March. Downstream at Martintown, Wis., the crest was 6.5 feet above flood stage on the 12th. At Freeport, Ill., the crest was 1.2 feet above flood stage on the 14th. The Rock River at Joslin, Ill., reached a record crest of 16.4 ft., on the 13th. The previous record stage was 16.23 feet in March 1948.

Tributaries to the upper Cedar in Iowa rose rapidly following the heavy rains. The crest stages were affected by ice action at several places and ranged from 0.2 foot above flood stage on the West Branch at Finchford, Iowa, to nearly 3 feet above flood stage on Blackhawk Creek at Hudson, Iowa.

The first appreciable snowfall of the season, ranging from 2 to 9 inches, on February 1, over Missouri and Illinois was followed by a general heavy rain on the 8th and 9th. Rainfall during this period averaged between 1 and 2 inches. The wet condition of the soil and the partially frozen ground contributed to appreciable runoff with rapid rises on most streams with considerable overflow. Extensive flooding occurred in all reaches of the Meramec River Basin in Missouri. Crests along the main stem of the Meramec ranged from 9 to 11 feet above flood stage. Flood damage was limited to areas where there was inundation of good farmland normally planted in winter grains. There was also some damage to farm buildings, roads, railroads, and bridges.

The resulting rise in the upper Mississippi River was the highest of record for February, particularly since the locks and dams have been in place (1935-36). The average monthly stage at La Crosse, Wis., was 7.7 feet; dating back to 1900 this was the highest of record. The previous highest February average stage was 5.5 feet in 1952. The long-term mean stage for La Crosse is 4.4 feet.

The only flooding along the main stem of the Mississippi occurred at Davenport, Iowa, Keithsburg, Ill., and Burlington, Iowa. The most serious flooding occurred around Davenport in the "Quad" City area. The warm temperatures during the period February 7-12 loosened the ice, moving it into pools 14 and 15. Ten miles below Dam 15, the ice began jamming. Before it could break loose sudden cold temperatures beginning on the 16th solidified the icejam, piling up floating ice until it was backed up to Dam 15. The snowmelt water plus a 1-inch rainfall runoff reached the icejam before it had solidified. This created a head of 10 feet above the jam raising the stage at dam 15 to 19.0 feet on February 22. This was the third highest stage of record recorded at Davenport. Flood damage (including flood fighting and cost of evacuation) in the Quad City area was near $1 million.

Missouri Basin.--Three to 5 inches of wind-packed snow covered the central Missouri Basin on February 1. It extended from the Black Hills of South Dakota to southwestern Minnesota. Heavy melting occurred on the 5th and 6th when maximum temperatures ranged up to 45° to 50° (except 35° to 45° in southwestern Minnesota). By the 8th, the snow cover had been reduced to 1 to 2 inches in South Dakota and 2 to 4 inches in southwestern Minnesota, and mostly drifts in northwestern Iowa. Heavy, warm rains during the 8th and 9th on frozen ground melted most of the old snow and caused unusual winter flooding on the Floyd, Rock, and Big Sioux Rivers. The flood on the Big Sioux was a strong threat to the Sioux City, S. Dak., area because of an adverse ice breakup. The ice broke up, from near the Iowa-Minnesota state line on both the Rock and Big Sioux Rivers down to Hawarden, Iowa, on the 9th. The ice continued to hold from the mouth of the Big Sioux at Sioux City to about 30 miles upstream. By the 11th, about 2 miles of solid ice at the mouth of the Big Sioux backed up a large icejam to about 15 miles upstream. In comparison with previous floods, the flood on the Big Sioux was moderate. Shallow lowland flooding occurred along the Rock below Rock Rapids, Iowa. Only minor damage resulted from the overflows.

Heavy rains were general on the 8th over practically all of the Elkhorn Valley of Nebraska. The resultant rapid runoff and breakup of ice in streams caused damaging floods in the vicinity of icejams along the Elkhorn and its tributaries. The soil over this area was frozen to depths of 8 to 20 inches, and practically all of the rainfall drained into the streams within a few hours. Rainfall in excess of 1 inch was recorded from Oakdale and Meadow Grove, Nebr., eastward to the Missouri River. Snowmelt was not an important factor in runoff, since average snow depths were only 1 to 2 inches on the morning of the 8th. Heavy damage resulted from these floods to bridges, parks, highways, and fences. Rapid rises of stream levels behind icejams caused flooding of several feed lots and the drowning of many cattle.

The flooding in the Little Sioux River Basin in northwestern Iowa from the 9th to the 11th was due to heavy rain during the night of the 8-9th. The rain, averaging 1 inch over central and northern portions, fell on frozen ground, resulting in rapid surface runoff. The flooding was confined to local lowlands and some farm fields.

Minor flooding occurred on the lower flood plains along Lincoln Creek and in the upper Big Blue River in Nebraska from the 9th to the 13th. The flooding was due to 2 to 3 inches of rainfall on the 8-9th. The previous snow cover of 4 to 7 inches in southwestern Nebraska had melted prior to the beginning of the rains on the 8th so was not a contributing factor. Losses were due principally to erosion and silting.

Minor flooding occurred on the Chariton River in Missouri on the 9-10th from the heavy rains on the 8-9th. The rain, combined with unseasonably warm temperatures, caused breakup of ice on the streams. Sharp rises occurred on other tributaries, notably the Grand River, but crests were well below flood stage.

Minor flooding occurred on the extreme upper Chariton River at Chariton, Iowa, on the 9th and 10th. No significant damage resulted.

The month of February began with a carryover of subfreezing temperatures, which began the latter part of January, continuing through February 6. The Missouri River had floating ice from above Sioux City, Iowa, to above Decatur, Nebr. In the reach from Decatur, Nebr., to just above Kansas City, Mo., the Missouri River was frozen over or bridged. Intermittent ice bridges and open reaches existed from Kansas City to the mouth. Ice action created irregular stage fluctuations during this period. A return to seasonal normal temperatures beginning on the 7th stopped the formation of new ice and within a few days the ice was moving out at all points. The only flooding that resulted was at Waverly, Mo., on the 9th.

Ohio Basin.--A warming trend beginning on the 8th resulted in a gradual depletion of the heavy snow cover over western Pennsylvania and eastern West Virginia. The water equivalent of the snow cover early in February ranged from 1.7 to 5.3 inches over the Allegheny Basin and from 1 to 7 inches over the Monongahela Basin. Rainfall averaging 0.25 inch on the 10th further depleted the snow cover and resulted in moderate to high base flows prior to the moderate to heavy rainfall on the 12th and 13th. The rainfall, ranging from 0.50 inch to 2.50 inches, produced flooding on the Monongahela and Allegheny Rivers between the 13th and 15th. An ice gorge on the Allegheny River in the East Brady, Pa., area caused backwater flooding to summer cottages and homes. The secondary and main thoroughfares to East Brady were closed, isolating the city for a 24-hour period. The highway bridge at East Brady, Pa., was damaged slightly and was closed until highway engineers approved its safety. This ice gorge was reported by local residents as being more serious and damaging than the historic ice gorge of March 1913. This gorge broke on the 14th and released backwater resulting in flood stages being exceeded along the lower Allegheny River. Serious flooding occurred along Chartiers Creek, at McKees Rocks, Pa. This highly industrialized area suffered severe damages at Heidelberg, Canonsburg, Bridgeville, and Carnegie, Pa.

There was 20 to 30 inches of snow on the ground in some of the mountainous areas of Virginia and West Virginia during the first part of February. Some of this snow began melting slowly on the 7th, but most of it did not melt until about the 10th, especially in the mountains. Little or no increase in flow of rivers occurred until about the 11th. By the time the rain began on the 12th, the ground was well saturated and most of the streams were still 1/4 to 1/2 full from snowmelt. Most of the rain causing the flood fell in the 24-hour period from 7 p.m., February 12 to 7 p.m., February 13, and averaged about 2 inches. On the New River, amounts ranged from 5.12 inches at Boone, N. C., to 1.72 inches at Radford, Va.

The Muskingum River went above flood stage at McConnelsville, Ohio, on the 13th and continued in flood at Marietta, Ohio, until the 16th. Flood stage at the latter point crested 4.3 feet above flood stage on the 15th. Flooding below the flood control reservoirs was minor. Flooding on the Hocking River at Athens and Enterprise, Ohio, was minor. The New River at Radford, Va., crested about 0.9 foot above flood stage on the 14th. Very heavy rain caused considerable flooding in the extreme headwaters near Boone, N. C. Minor to moderate flooding occurred on Paint and Beaver Creeks, tributaries of the Big Sandy River. Some flooding occurred on the Little Sandy River in Kentucky. Heavy damages resulted from the flooding.

On the Hocking River, many highways were cut off by high water. Low-lying farmlands along the river were flooded. The water in Athens, Ohio, covered some low-lying areas, particularly the West Green of Ohio University. Some garages had to be evacuated. Waters covered low-lying sections of several streets.

In Chauncey, Ohio, on Sunday Creek, a tributary of Hocking River, 28 homes were affected. Evacuation was necessary for a dozen families while others moved furniture from first to second floors in their homes. Damages on Hocking River totalled $209,000.

Rutland, Ohio, a small town in Meigs County on Leading

Creek, was hit by a flash flood the morning of February 13. Considerable damage occurred to flooded homes. Meigs County Agricultural Agent reported water in basements in many homes. The flooding was partially caused by creek channel being filled with sand from strip mining operations. Damages were estimated at $41,800 by the County Agent.

New Martinsville, W. Va., had about a foot of water on Main Street in the area of the Post Office. Martin Avenue was covered with water in its entirety and North Street from near the Moose Lodge to Main Street. Many stores moved out merchandise, but water did not get in stores.

Most of the damage to commercial property in Wood County, W. Va., was in Vienna. This was caused by backwater. The flooding entered a number of commercial buildings and damaged some merchandise and equipment but the main damage was to the buildings and in post-flood cleaning and repair. The Wood County Extension Agricultural Agent estimated total damage in Wood County, W. Va., as $104,000.

About 46 families in the Marietta, Ohio, area moved out of the lowland areas. Several downtown streets were inundated. Merchants moved merchandise and equipment from basements.

Paint Creek, a tributary of Big Sandy River, overflowed its banks and blocked Fishtrap Road in Johnson County and U. S. Highway 460 between Salyersville and Paintsville. Middle Fork Road on Jenny's Creek, which flows into Paint Creek, was covered by water.

Beaver Creek, a tributary of Big Sandy River, overflowed bottom lands along the creek. Small amount of erosion of soil. No major damage.

Watauga County, N. C., headwaters of New River had considerable flooding, along river bottoms. Some damage resulted to highways and bridges. Some residents had flooded basements. Watauga County Extension Agricultural Agent estimated damages in Watauga County at $129,700.

The water equivalent of the snow cover in the Scioto Basin in Ohio averaged 0.8 inch the beginning of the month. The snow began melting on the 5th and 6th and disappeared rapidly on the 7th and 8th. Heavy rain occurred over the basin on the 10th, and on repeated intervals through the 17th. Considerable ice covered the upper Scioto when the rain began on the 10th. The ice was 4 to 8 inches thick and broke up readily without any jamming as the stream flow increased. Some lowlands and secondary roads were flooded in the lower Scioto drainage from the 11th to the 17th. There was also some minor flooding on the upper Scioto near La Rue, Ohio.

A snowstorm, the last of January and the first 2 days of February, deposited a 6- to 14-inch snow cover with a water equivalent of 1 to 1-1/4 inches over the Green River Basin. The snow melted slowly during the next few days saturating the ground. Heavy rains (1 1/2 to 2 inches) on the 10-11th followed by 1/2 to 1 inch rains on the 13th produced minor flooding on the Green River at Woodbury, Ky., on the 15th and at Calhoun, Ky., on the 15-20th. Minor flooding also occurred on the Skillet Fork and Saline Rivers in Illinois. Damages, if any, were small.

Minor overflow occurred along the Muscatatuck River at Austin, Ill., from the 10th to the 15th and along the lower White at Edwardsport, Ind., on the 13th and at Petersburg, Ind., on the 13-17th. This flooding was due to snowmelt and heavy rain, (1.5 inches) over the lower White and East Fork on the 10th and 11th.

The flooding in the upper Cumberland Basin in Kentucky on the 13th and 14th was due to heavy rains (2 to 3 inches) during the night of the 12th and morning of the 13th. The ground was thoroughly saturated prior to this rain due to melting snow and rain on the 11th so runoff was heavy. Minor damage occurred to homes in the Baxter, Ky., area.

Considerable damage was reported to bridges and highways in the Cumberland, Ky., area. One death resulted in Letcher County when a boy fell from his bicycle into the flood waters.

Heavy rains over the French Broad Basin during the night of the 12th and morning of the 13th caused flooding between the 13th and 15th. The rainfall averaged from 2.5 inches at Marshall, N. C., to 6.3 inches at Rosman, N. C. From Asheville to Rosman, N. C., the rainfall averaged near 5 inches. The main stem of the French Broad River exceeded flood stage by 1.1 foot at Asheville, N. C., to 4.5 above bankfull stage at Rosman, N. C. Approximately two-thirds of the homes at Rosman were flooded and several of the homes had to be evacuated. Mud slides blocked several highways in western North Carolina while high water across other roads made them impassable. The airport at Franklin, N. C., was completely under water. The school on Blannerhassett Island at Marshall had water 2 feet deep in the basement. All Equipment was removed before the flood waters reached the basement.

Rains beginning on early morning of the 12th and continuing through noon of the 13th produced serious flash flooding in the city of Gatlinburg, Tenn., and flooding on the Little Pigeon River at Sevierville, Tenn. The rainfall averaged 1.5 to 3.0 inches in east Tennessee. Snowmelt from the snow cover in the Smoky Mountains added additional runoff. Flash flooding on the Little River inside the park between Gatlinburg and Townsend, Tenn., seriously damaged Highway #73 inside the park. Minor flooding occurred on the Tuckasegee River at Bryson City, N. C., on the 13th. Two distinct rises occurred on South Chickamauga Creek at Chickamauga, Tenn. The first occurred between the 13th and 15th with a crest of 13.15 feet on the 14th. Flood stage is 10 feet. The second occurred on the 16-17th with a crest about 2 feet lower. The only flooding along the main stem of the Tennessee occurred at Whitesburg, Tenn., from the 13th to the 19th and at Gilbertsville, Ky., from the 14th to the 26th. The crests ranged from 3.6 feet above flood stage at Whitesburg to 5.4 feet above flood stage at Gilbertsville, Ky.

The main stem of the Ohio went above flood stage between the 13th and 18th and continued in flood until the 27th at Shawneetown, Ill., and Fords Ferry, Ky. Flood stage was exceeded by up to 9 feet at Dam 50, Fords Ferry, Ky. In comparison with other Ohio River floods, this flood was considered comparatively minor.

White Basin.--The Cache River at Patterson, Ark., went above flood stage on January 2 and was still in flood at the end of February. The crest on January 14 was over 4 feet above flood stage. The one on February 16 was 2 feet lower.

The other streams in the basin went out of their banks on the 9th and 10th due to heavy rains between the 8th and 10th. Buffalo River at Gilbert, Ark., rose sharply to a crest 39.3 feet on the 9th (flood stage, 30 feet). This was the third highest crest of record. The Black River at Black Rock, Ark., went above flood stage on the 10th and continued in flood until the 25th. The crest on the 10th was 8.3 feet above flood stage. The main stem of the White was out of its banks on the 10th and 11th at Calico Rock and Batesville, Ark. Flood stage was not reached until the 16th at Clarendon, Ark. The only flooding in the reach between occurred at Georgetown, Ark., from the 19th to 26th. St. Charles, Ark., did not reach flood stage until the 27th. Several highways were temporarily closed by high water and landslides. The airport at Harrison, Ark., was temporarily closed due to flooding and runway cave-in. The damage to private and public property totalled near $300,000.

Arkansas Basin.--The only flooding in the Arkansas Basin during February occurred on the Illinois and Poteau Rivers between the 9th and 12th. Since there were no growing crops in the flooded area, little damage occurred except to roads and streets. This flooding was due to heavy rain on the 9th and 10th.

Red Basin.--The Sulphur went out of its banks at Naples, Tex., on the 14th and continued in flood until the 19th. The crest on the 16th was 3.5 feet above flood stage. This flooding was due to 1 to 2 inches of rain on the 9th and 10th.

Lower Mississippi Basin.--The middle portion of the St. Francis Basin was in flood from the 12th through the 26th. This flooding was due to rainfall on the 8-10th which averaged about 2 inches above Wappapello Dam. Most of the rain occurred on the 9th. Heavy runoff occurred as the ground was saturated from melting snow. The rainfall was heavier in the middle and lower portion. The loss in this flood was relatively small since the flood of early January had already inundated the newly-plowed and fall-seeded fields.

Rains in excess of 7 inches on the 9-10th caused flooding on the Cold Water, Yazoo, and Big Black Rivers in Mississippi. Most of the rain occurred during the 12-hour period ending at 6 a.m. on the 10th. A new 24-hour record of 8.62 inches occurred during February at Vicksburg, Miss. The flooding on the Cold Water River at Sarah, Miss., was of short duration. The river was back within its banks on the 11th. The lower Yazoo River continued in flood from the 13th to the 21st. The Big Black River went out of its banks at Bovina, Miss., on the 10th and was still in flood at the end of the month. The principal damages were to winter pastures, and farm- and timberlands.

WEST GULF OF MEXICO DRAINAGE

Minor flooding occurred on the Mermentau and Calcasieu Rivers in Louisiana and on the Sabine River in Texas between the 10th and 25th. This flooding was due to heavy rains on the 10-13th and 16th. Work on the Toledo Bend project and the salt water barrier project at Lake Charles, La., was halted until the waters subsided. Fish camps and some homes built in the lowlands were cut off and some were flooded.

Bankfull stage occurred on the Trinity River at Moss Bluff, Tex., on February 1 due to rains that occurred on January 29. Excessive rains on the 9th and 10th produced 2.5 to 3.0 feet of overflow at Liberty, Tex., and at Moss Bluff, Tex., between the 10th and 24th. Flooding occurred on Pine Island Bayou near Voth, Tex., from the 14th to the 17th. This overflow was due to upstream runoff.

PACIFIC SLOPE DRAINAGE

Sacramento Basin.--The overflow moving down the Sacramento River on the 4th and 5th brought overflow to the Colusa and Tisdale Weirs of the Sacramento River Flood Control System between the 5th and 9th.

FLOOD STAGE DATA

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. They were also equipped with carbon hygristors. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.C.T.

R More than half of the observations are from statistical values.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available.

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from lithium chloride hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes; dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots.

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

FEBRUARY 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	55	17	7	17	22	17	23	-10	-2	-30	5	1	21	18	-57	-15	-4	54	71	55	35	57	87	105	125	119	144	65				36

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. **The value represents the total incoming minus the total outgoing radiation of all wave lengths.**

These data are of an experimental nature and are published as received from the Huntley Exp. Station. **The instrument with which they were measured has not been checked by the Weather Bureau.**

TOTAL OZONE DATA

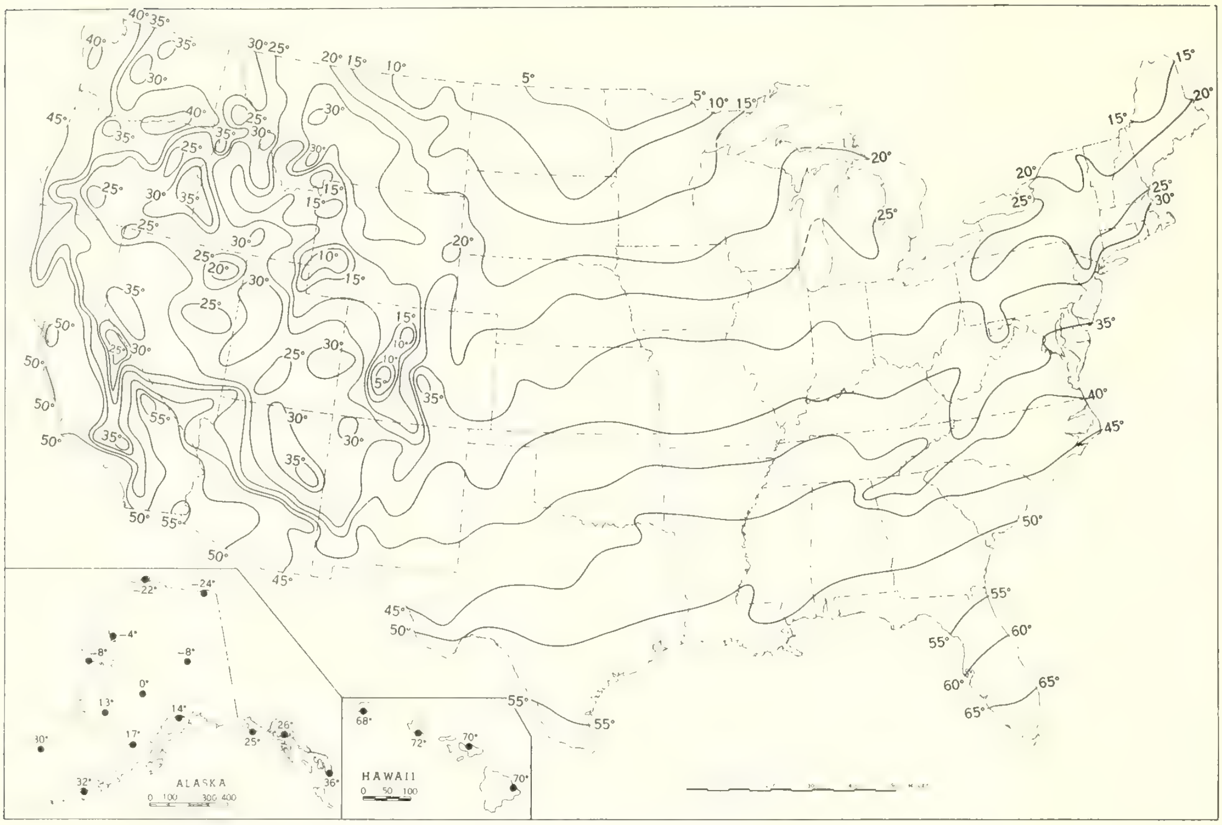
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λsΩΩΩ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

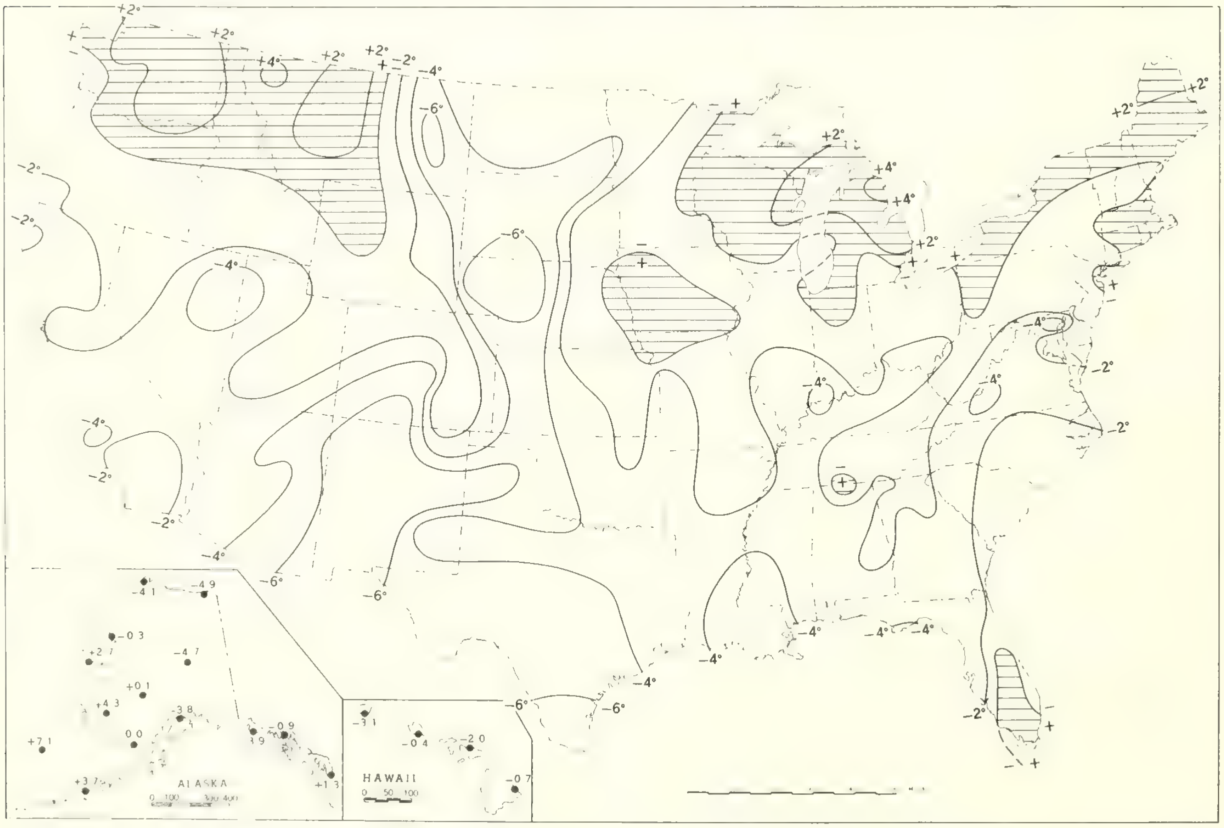
Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded ΩΩΩ) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

Chart I. A. Average Temperature (°F.) at Surface, February 1966.



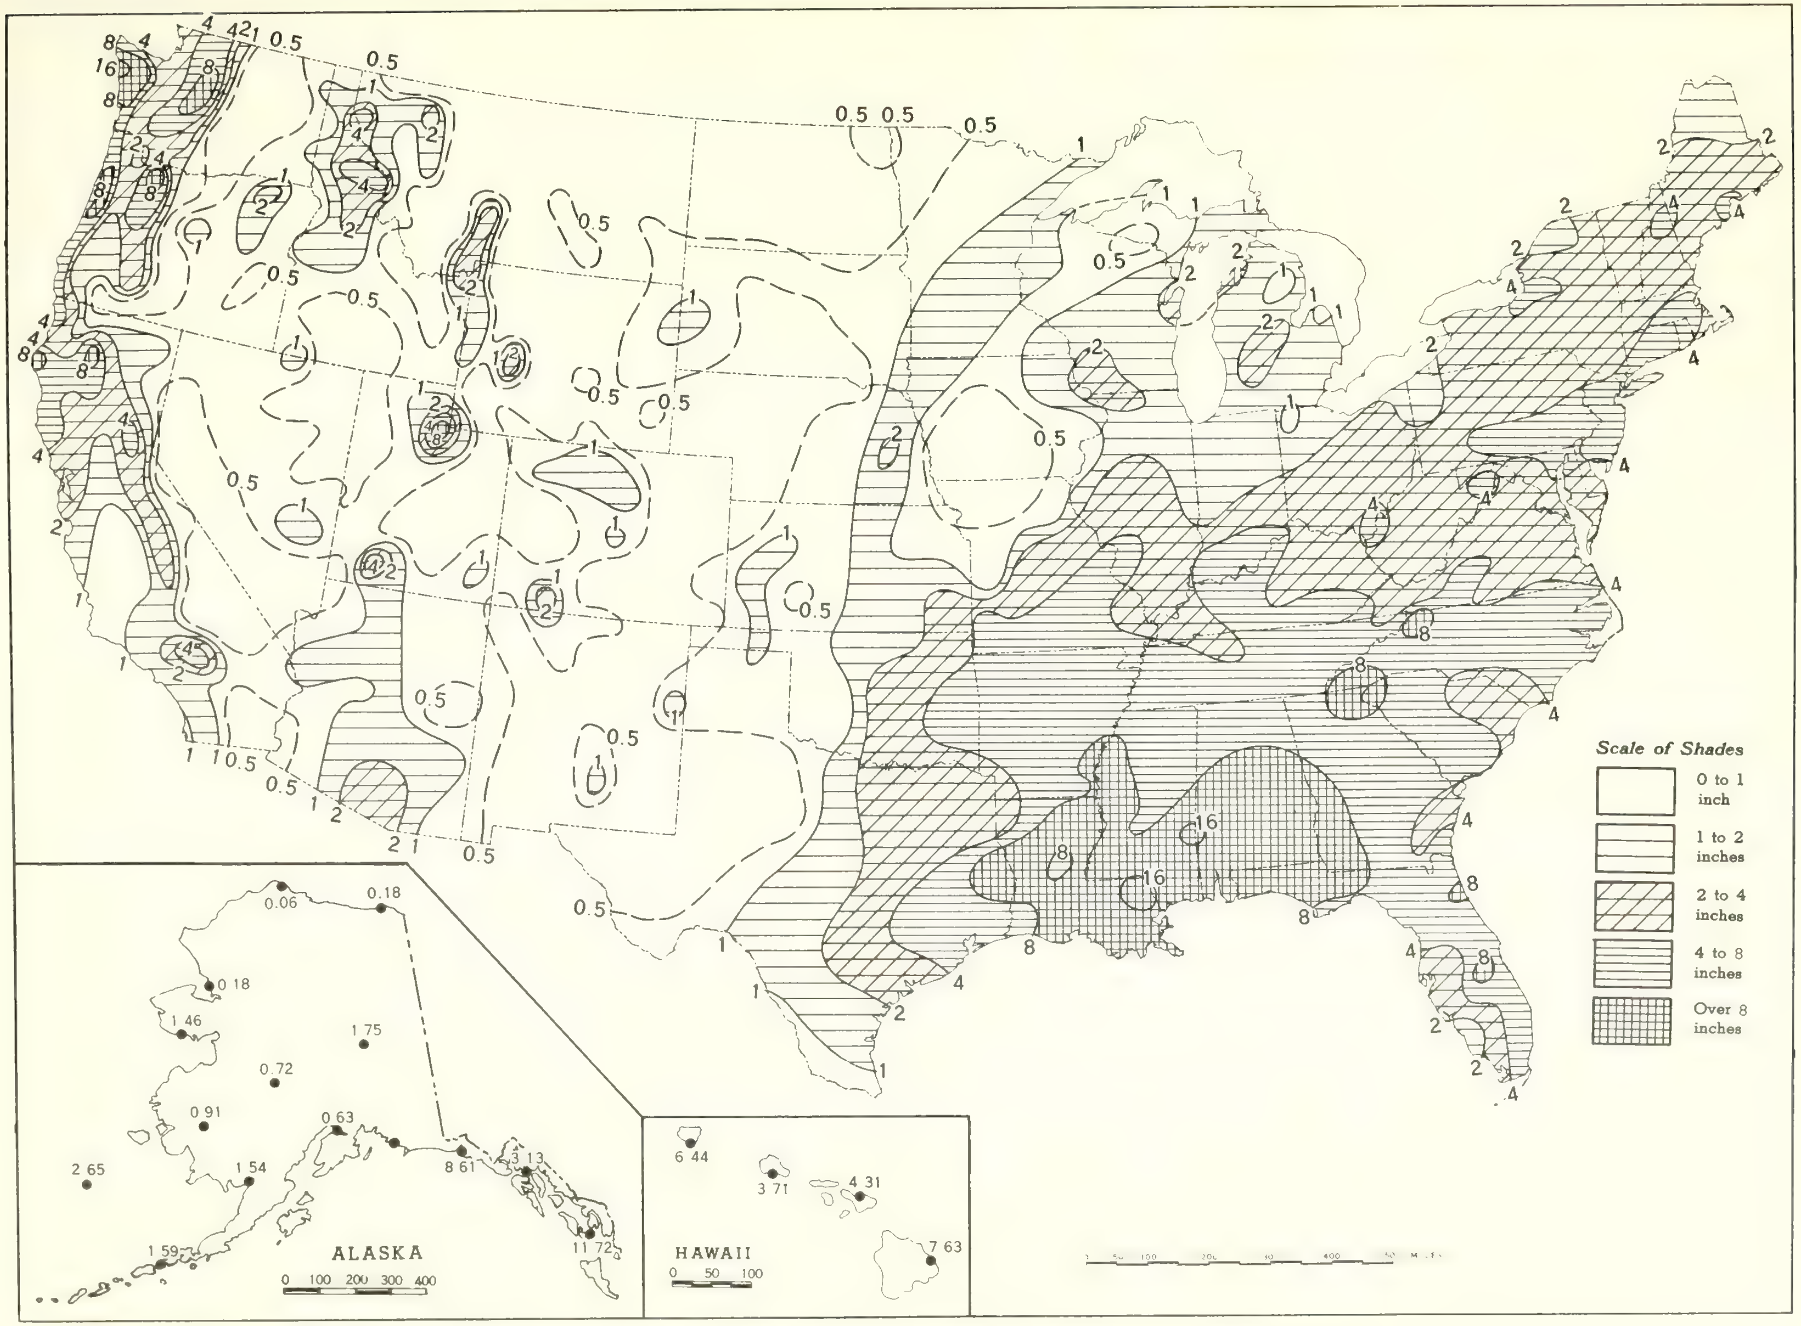
B. Departure of Average Temperature from Normal (°F.), February 1966.



A. Based on reports from over 870 Weather Bureau and cooperative stations. The monthly average is half the sum of the monthly average maximum and monthly average minimum, which are the average of the daily maxima and daily minima, respectively.

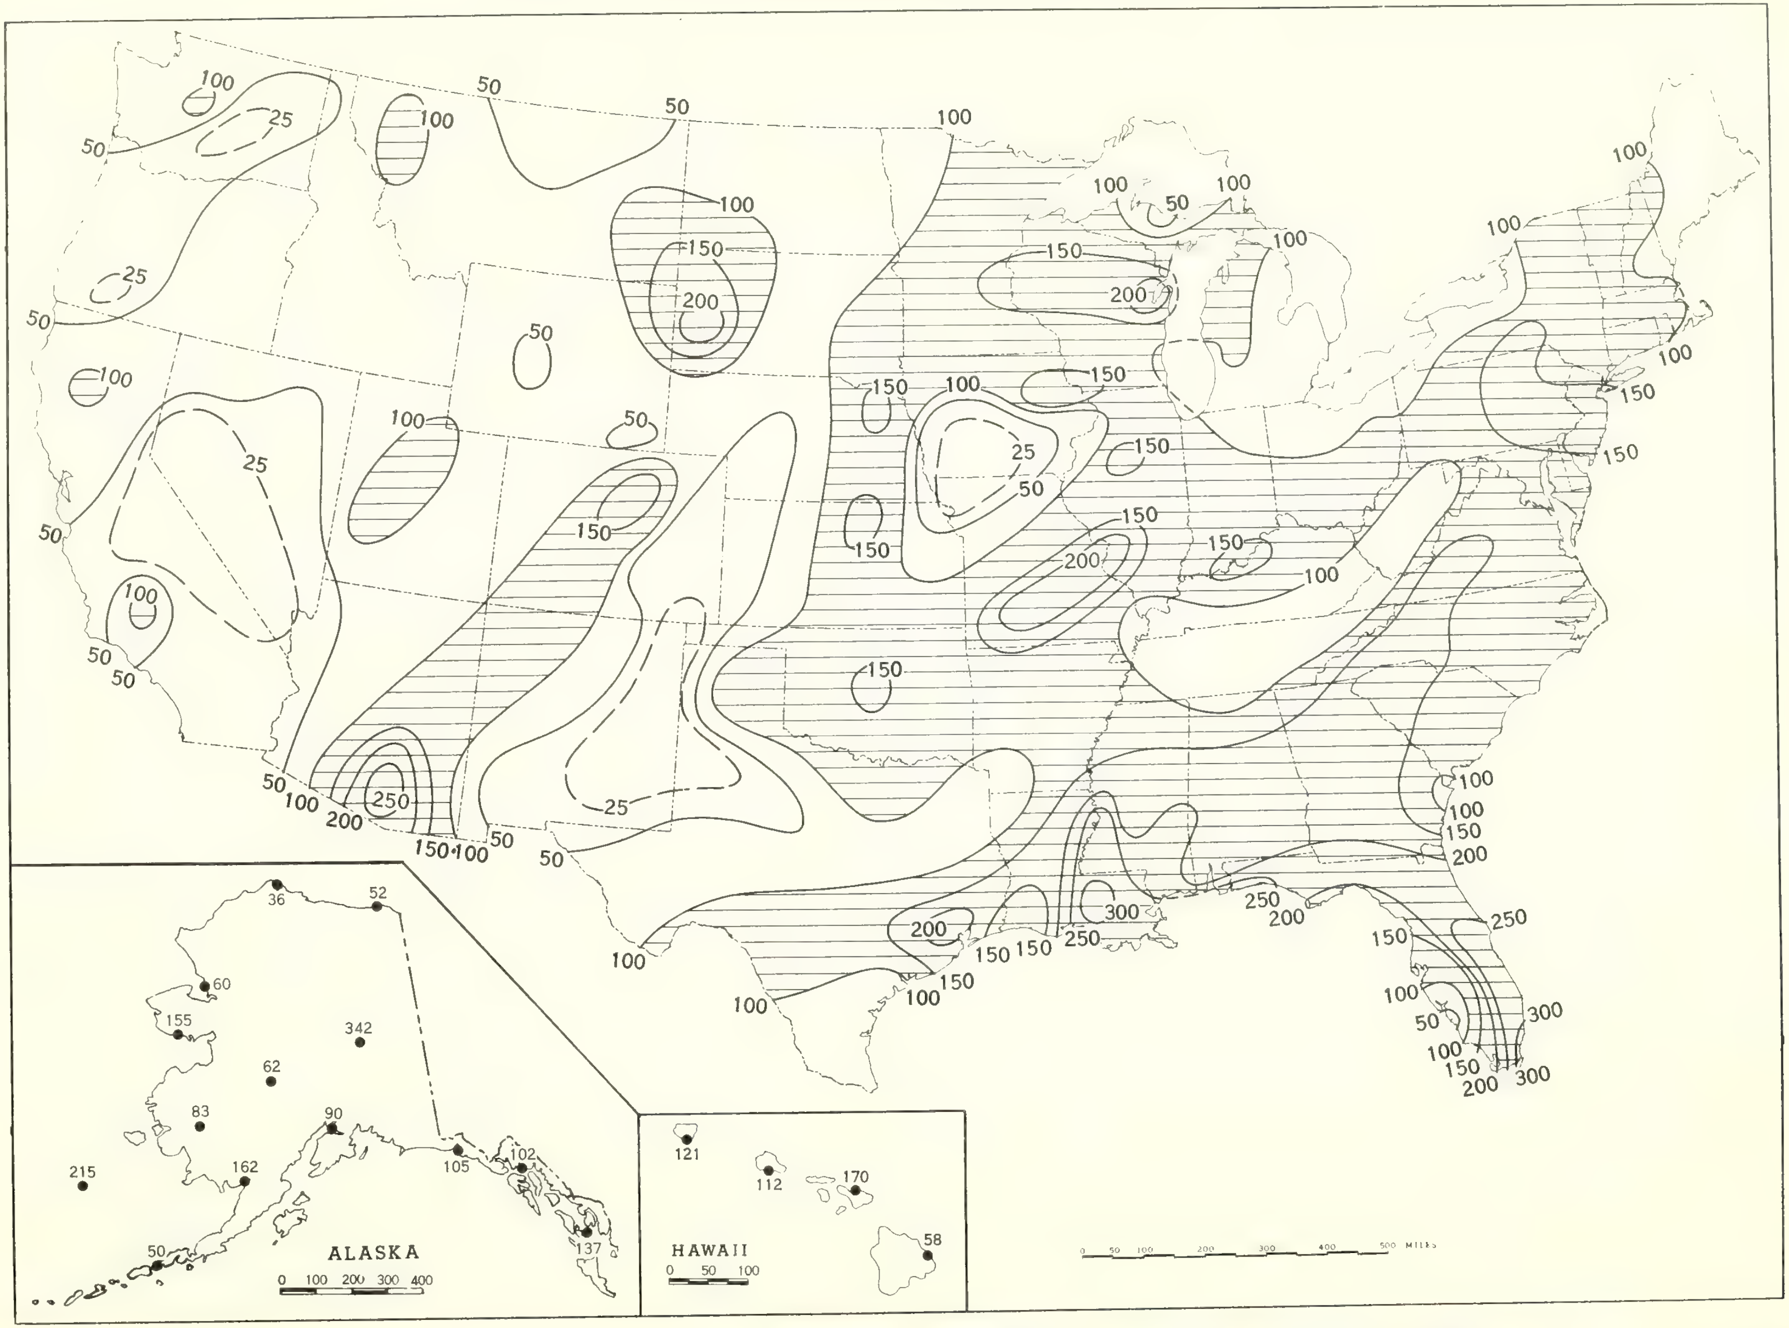
B. Departures from normal are based on the 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart II. Total Precipitation (Inches), February 1966.



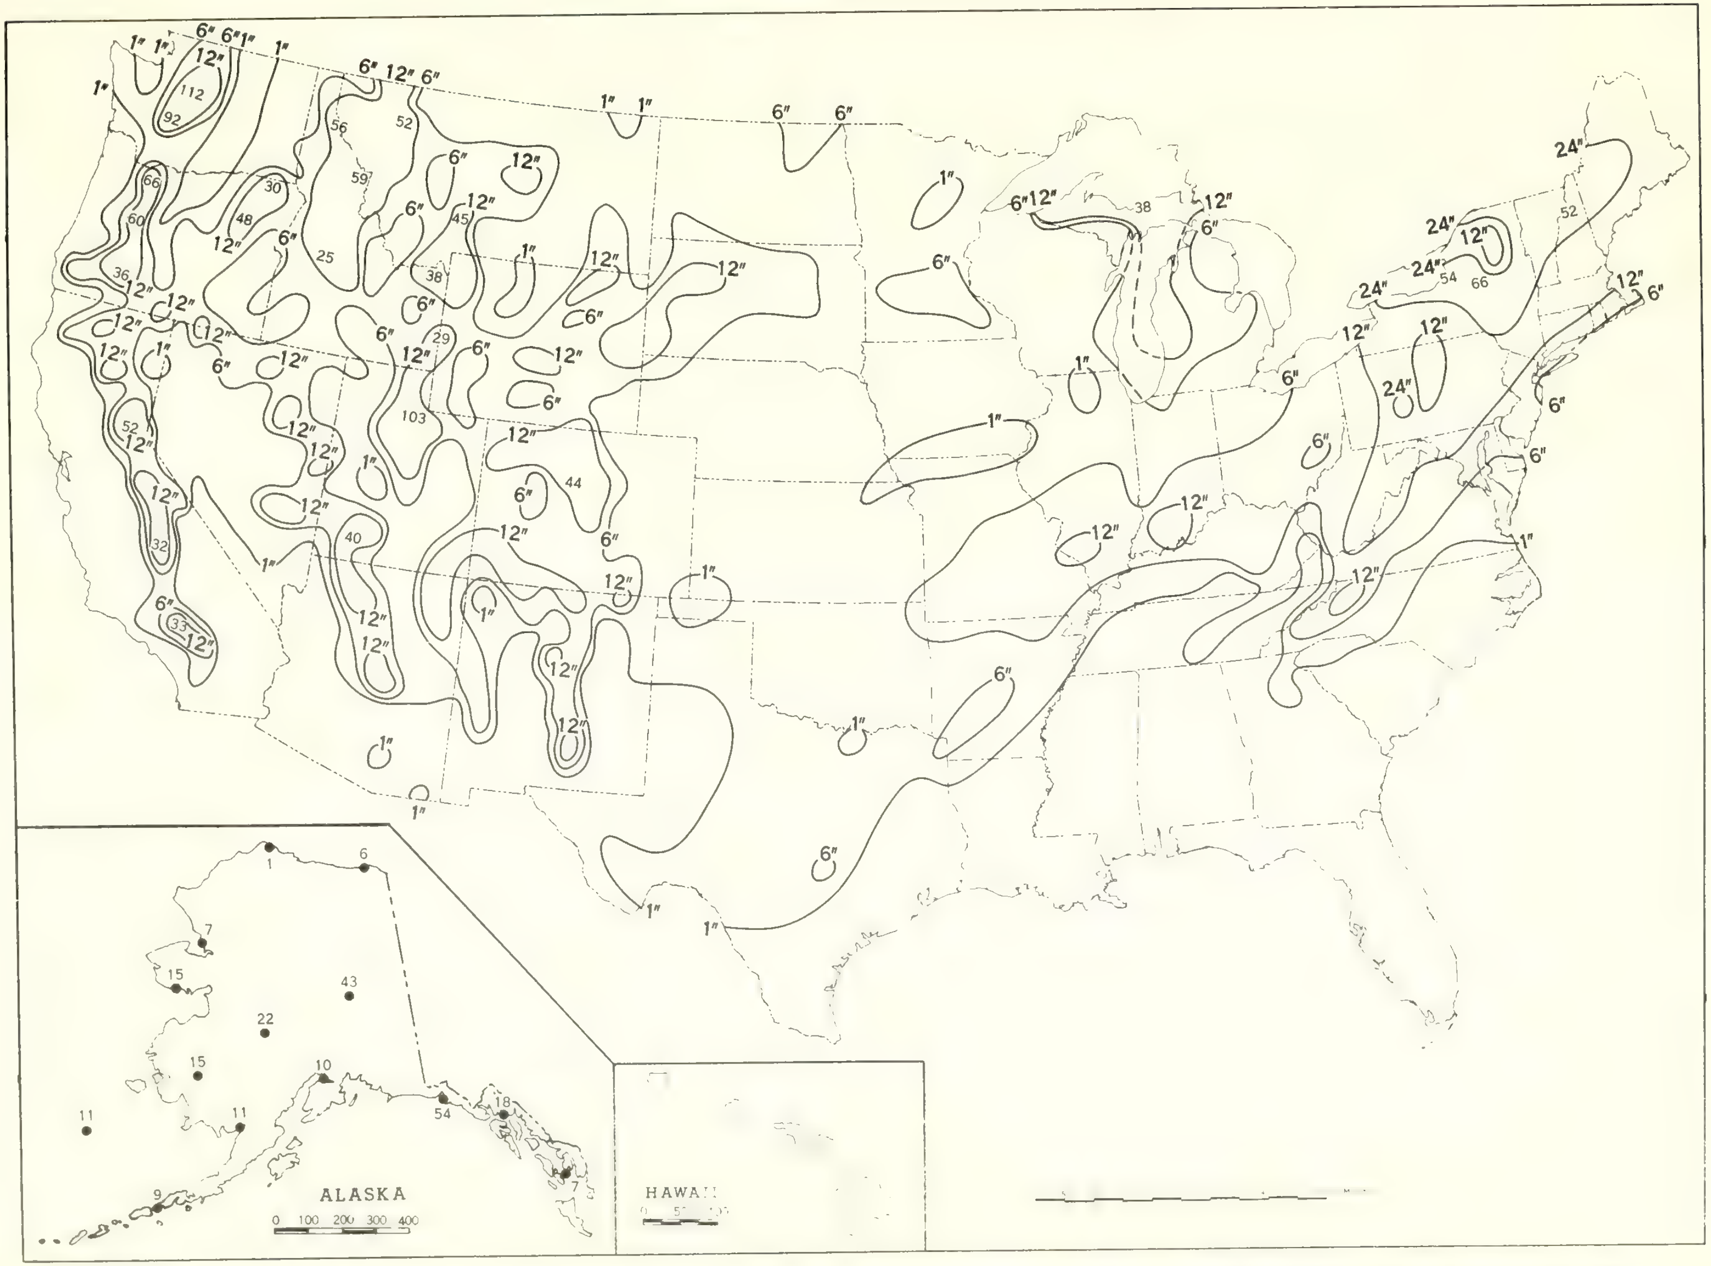
Based on daily precipitation records at about 870 Weather Bureau and cooperative stations.

Chart III. Percentage of Normal Precipitation, February 1966.



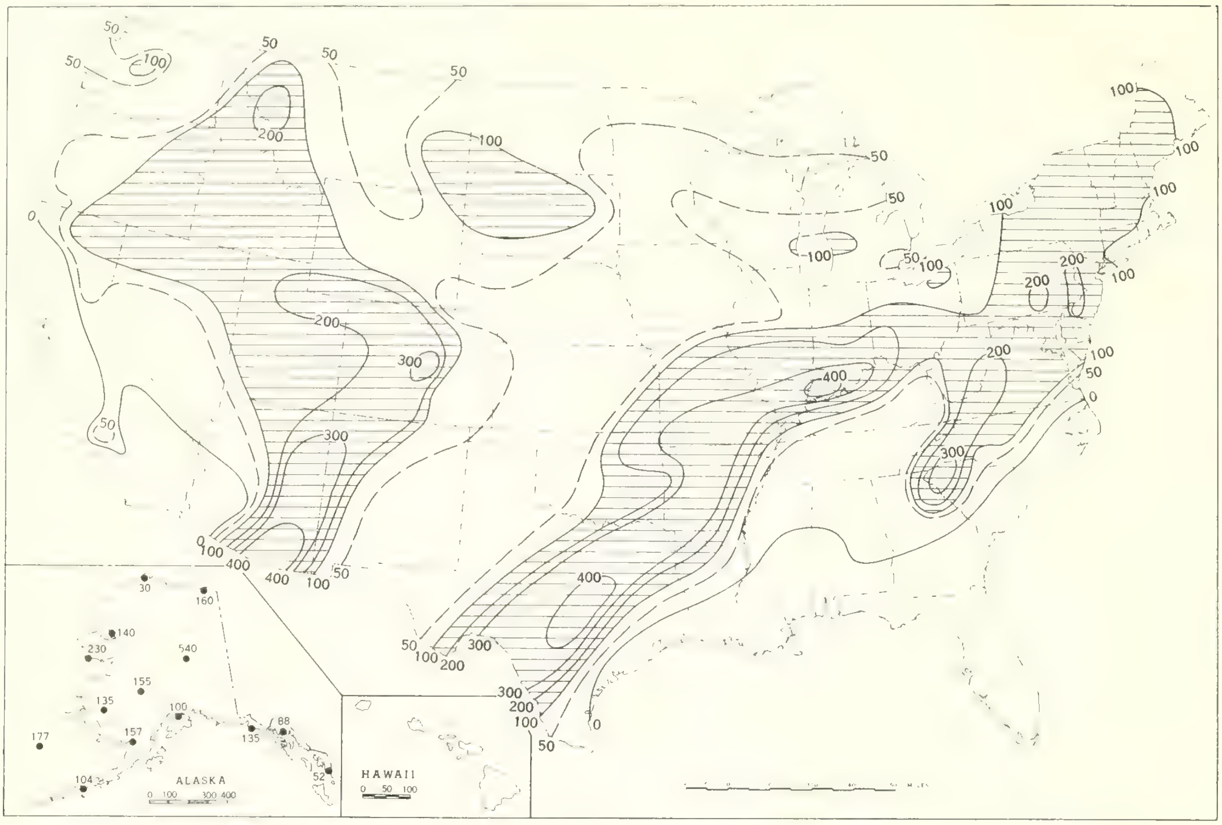
Normal monthly precipitation amounts are computed from 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart IV. Total Snowfall (Inches), February 1966.

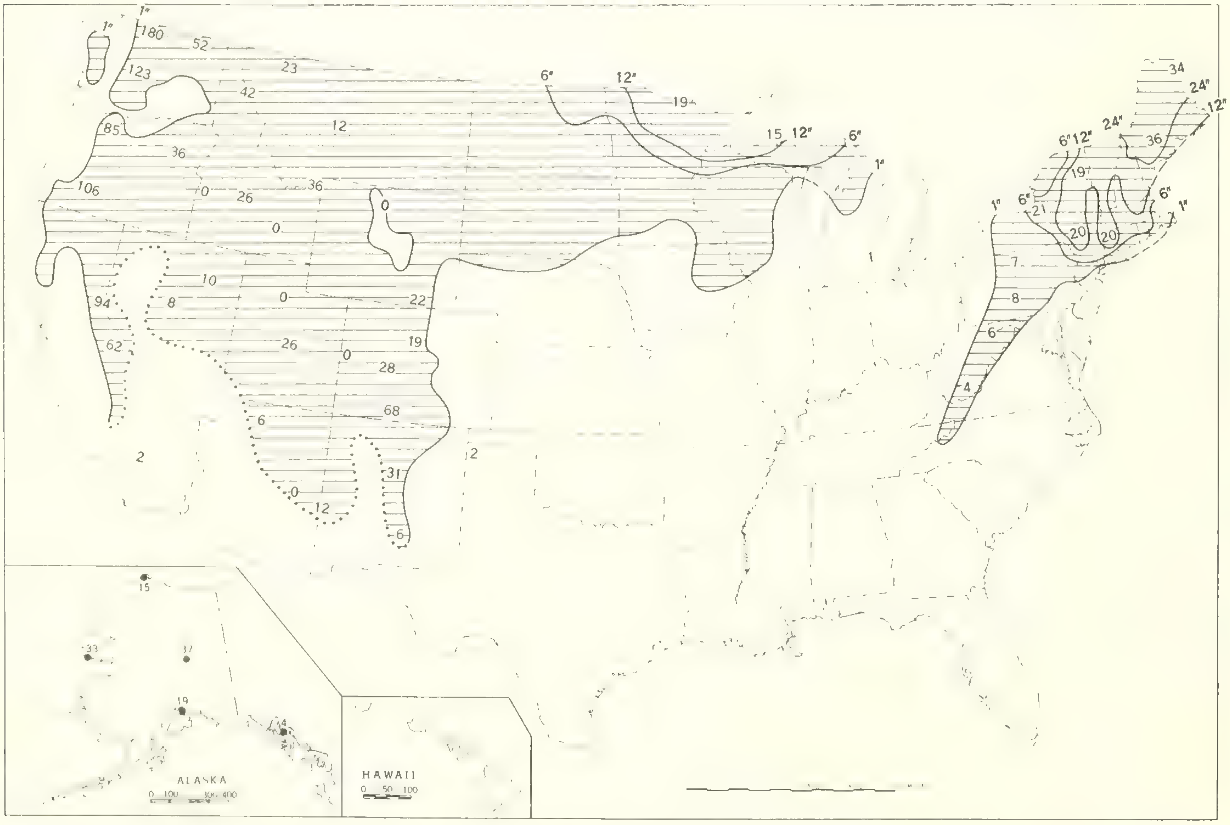


This is the total of unmelted snowfall recorded during the month at Weather Bureau and cooperative stations. This chart and Chart V are published only for the months of November through April although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, February 1966.

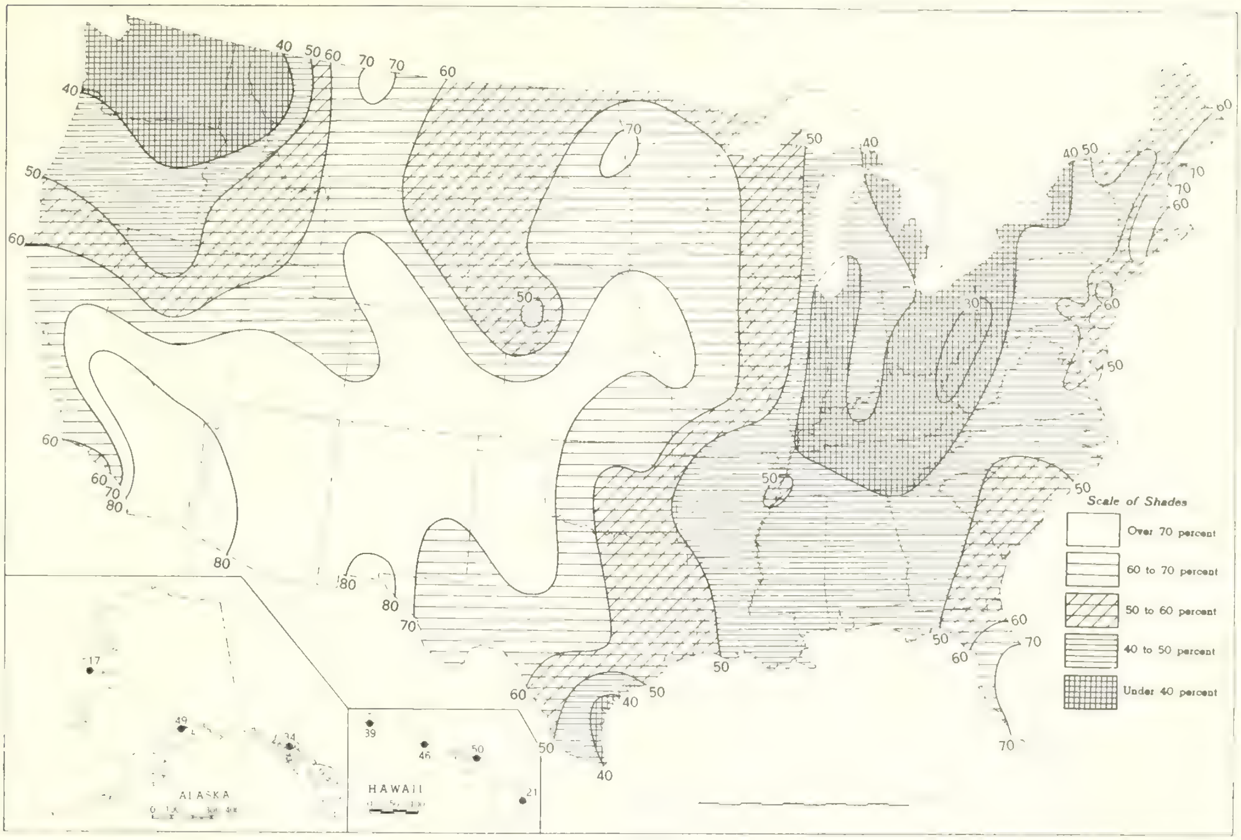


B. Depth of Snow on Ground (Inches), 7:00 a. m. E. S. T., February 28, 1966.

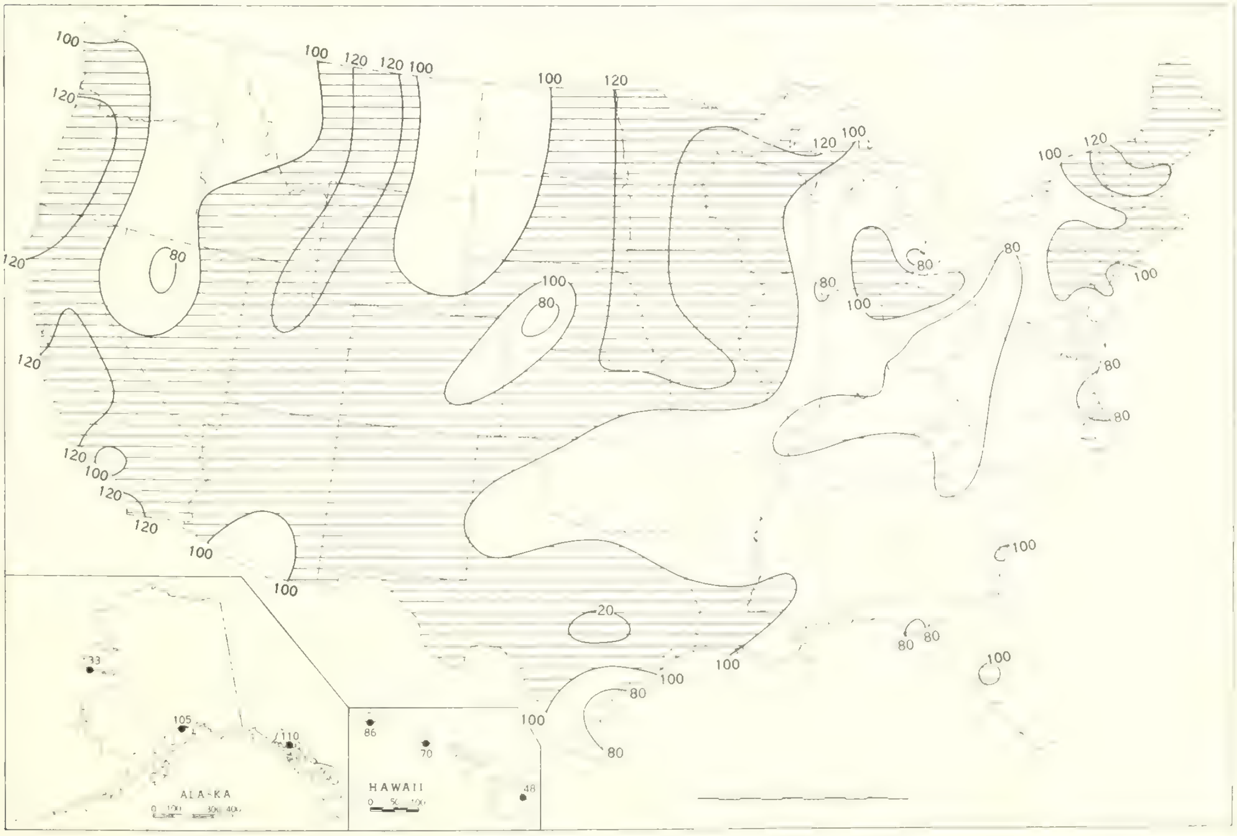


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a. m. E. S. T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, February 1966.

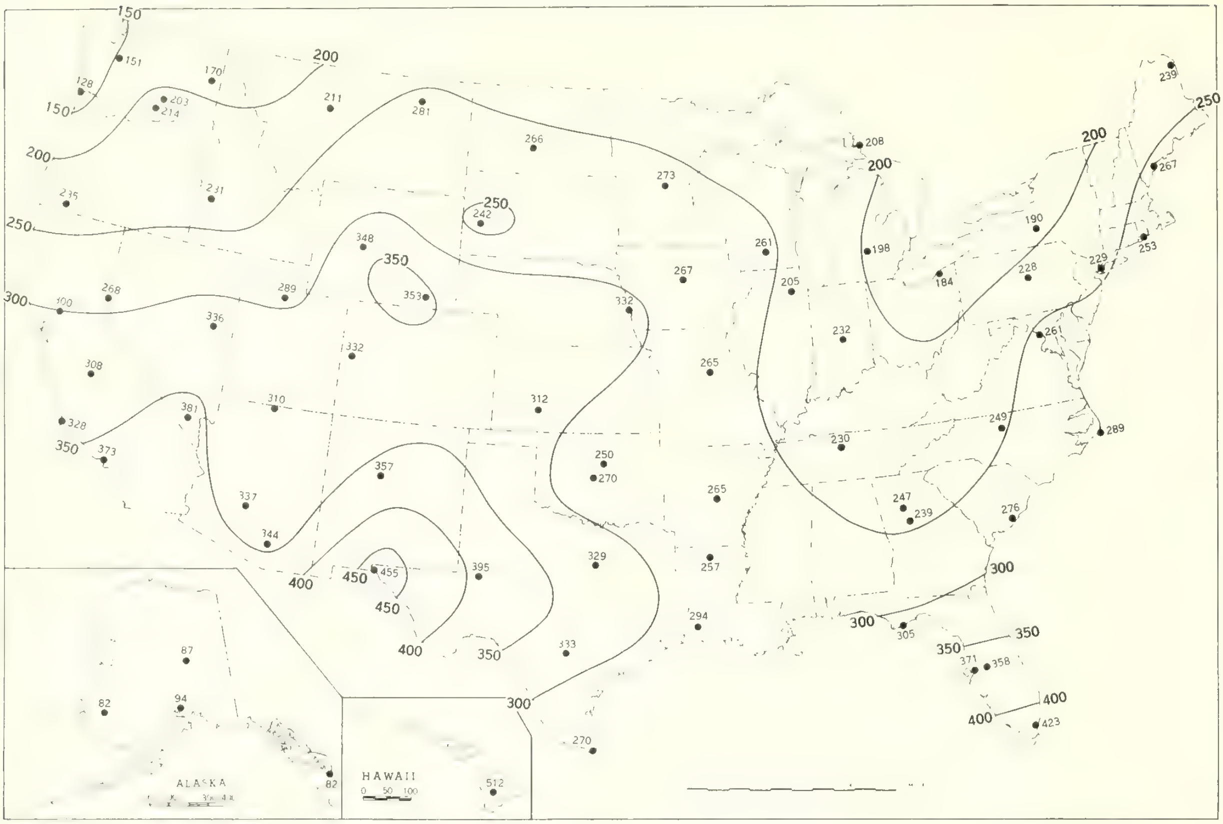


B. Percentage of Mean Monthly Sunshine, February 1966.

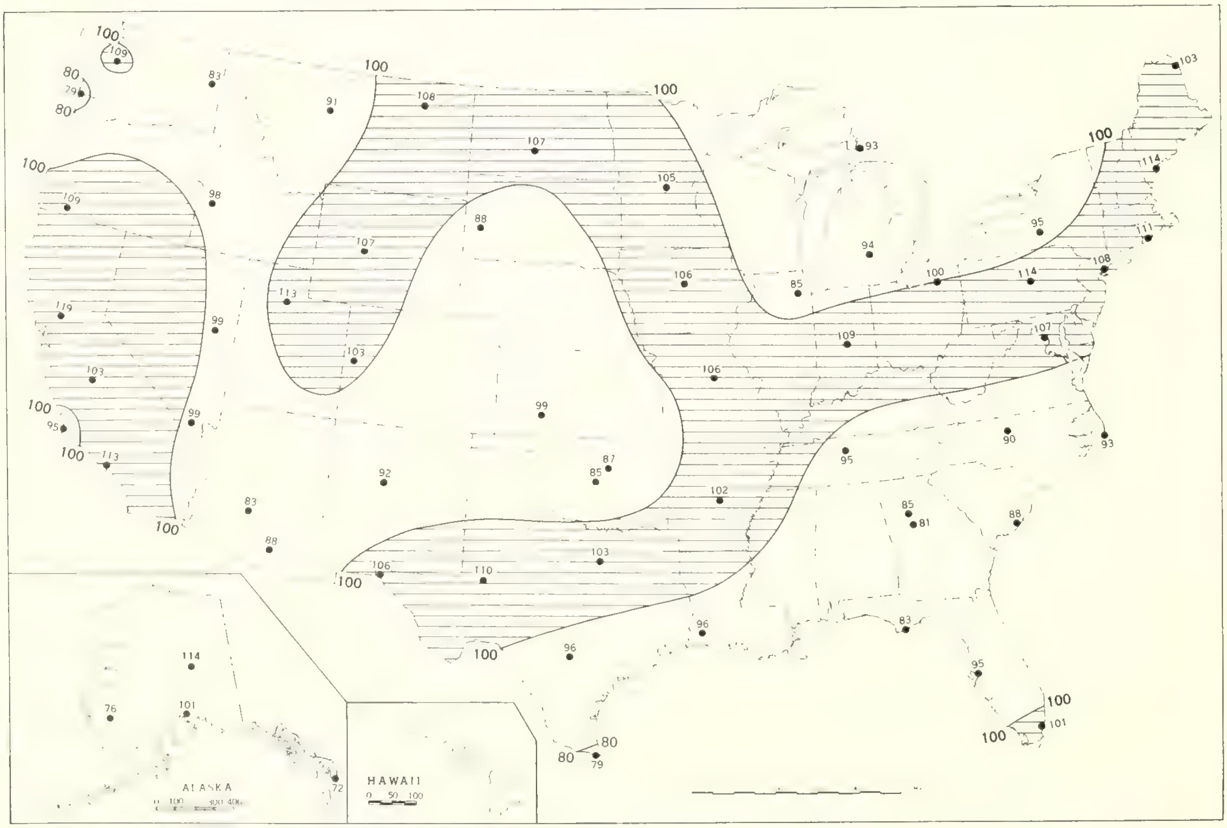


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, February 1966.

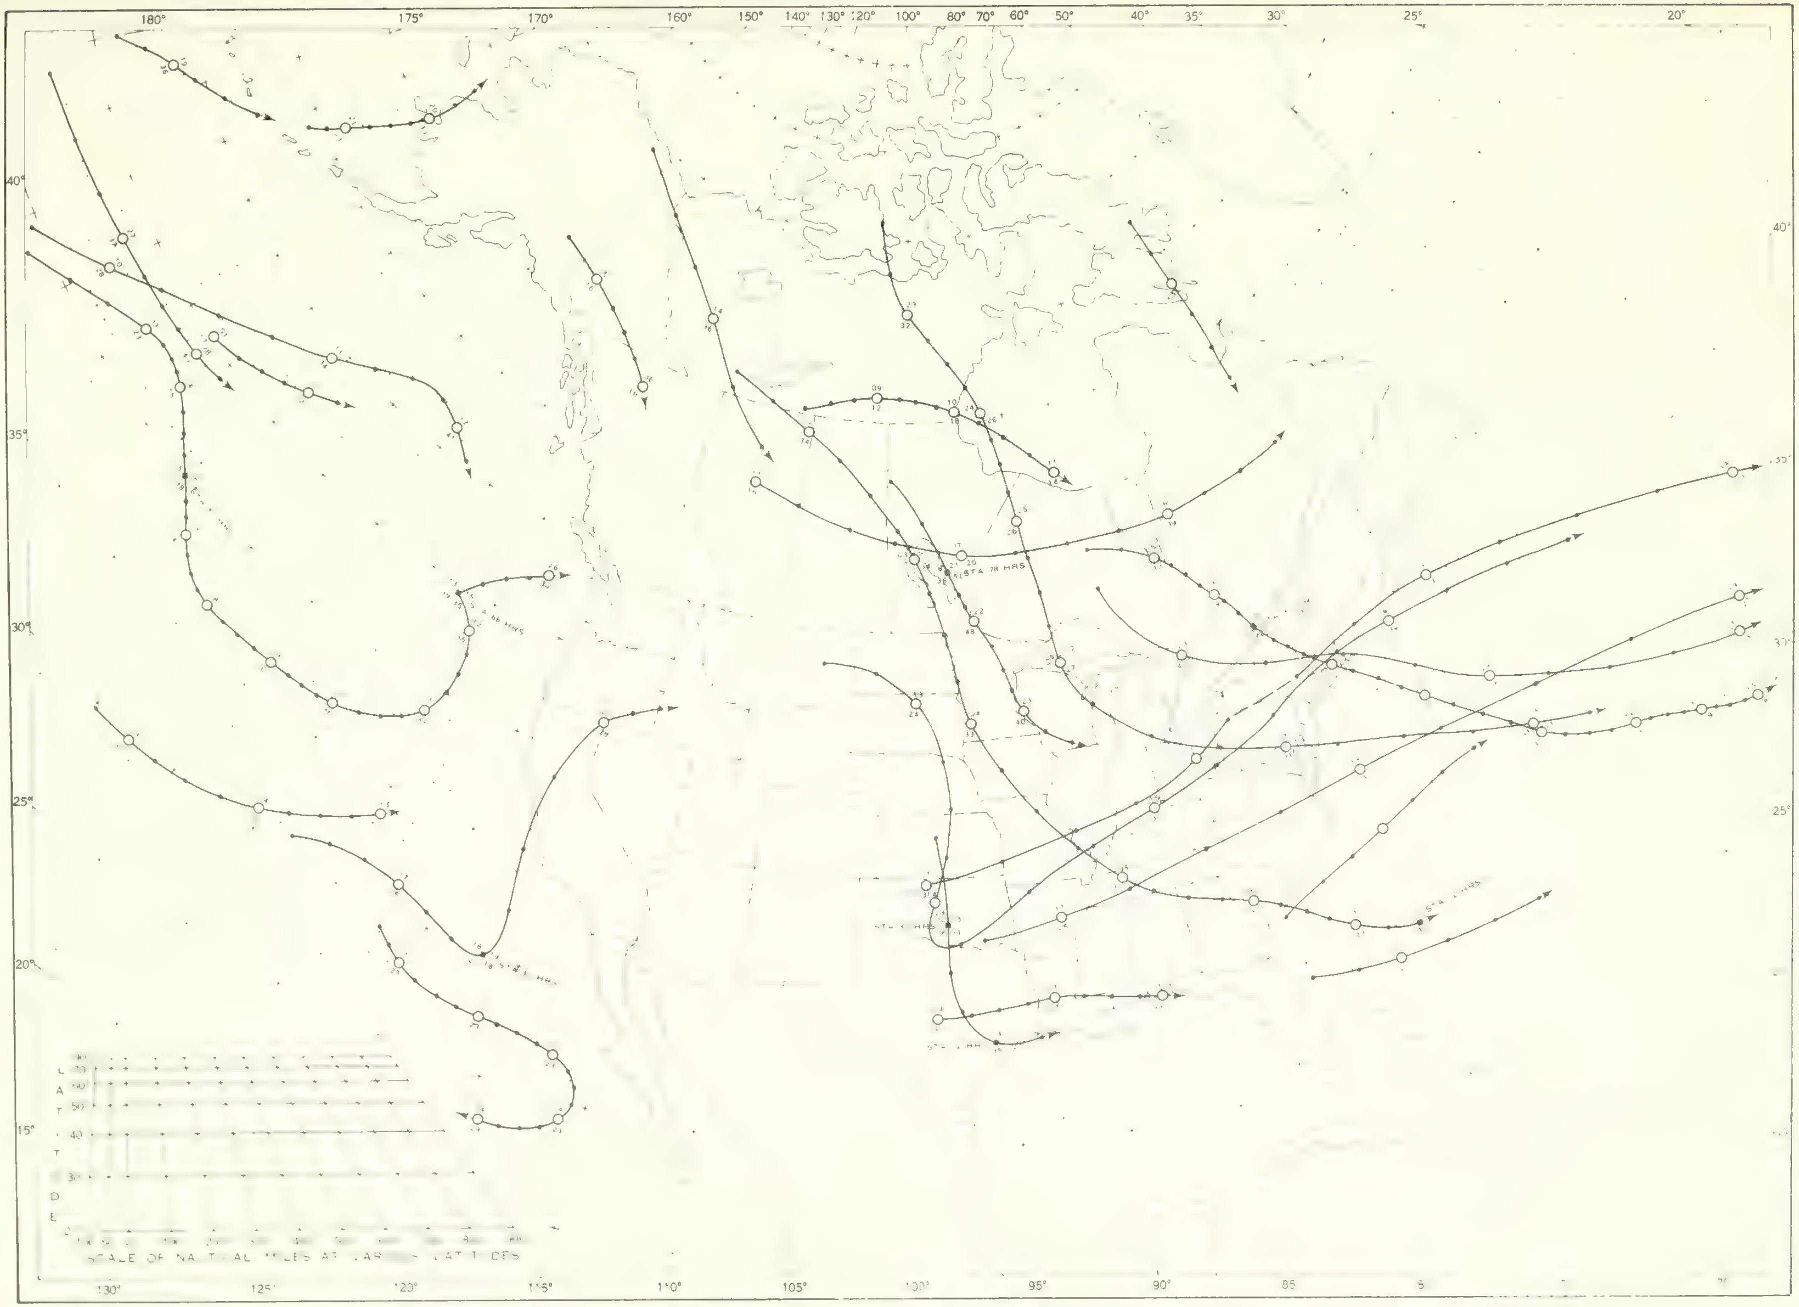


B. Percentage of Mean Daily Solar Radiation, February 1966.



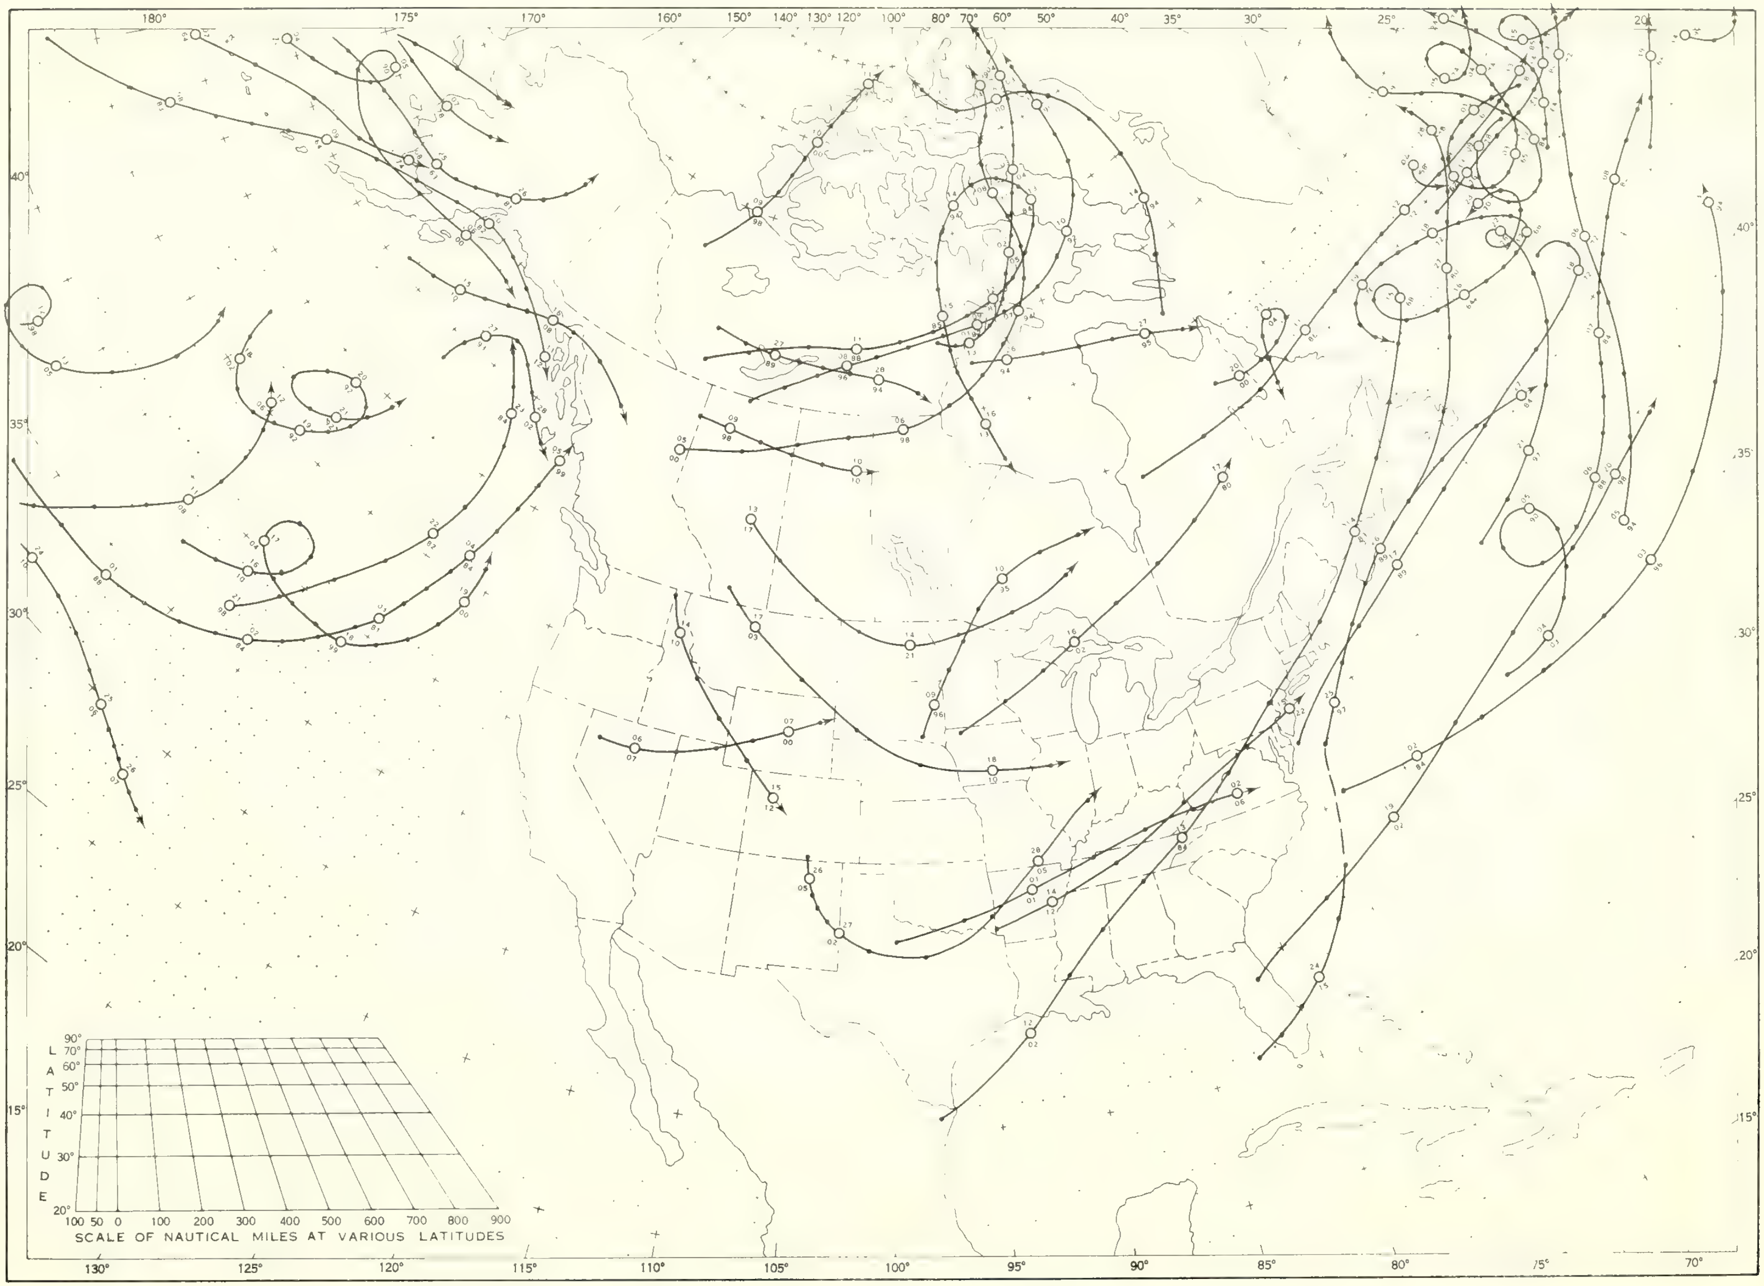
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, February 1966.



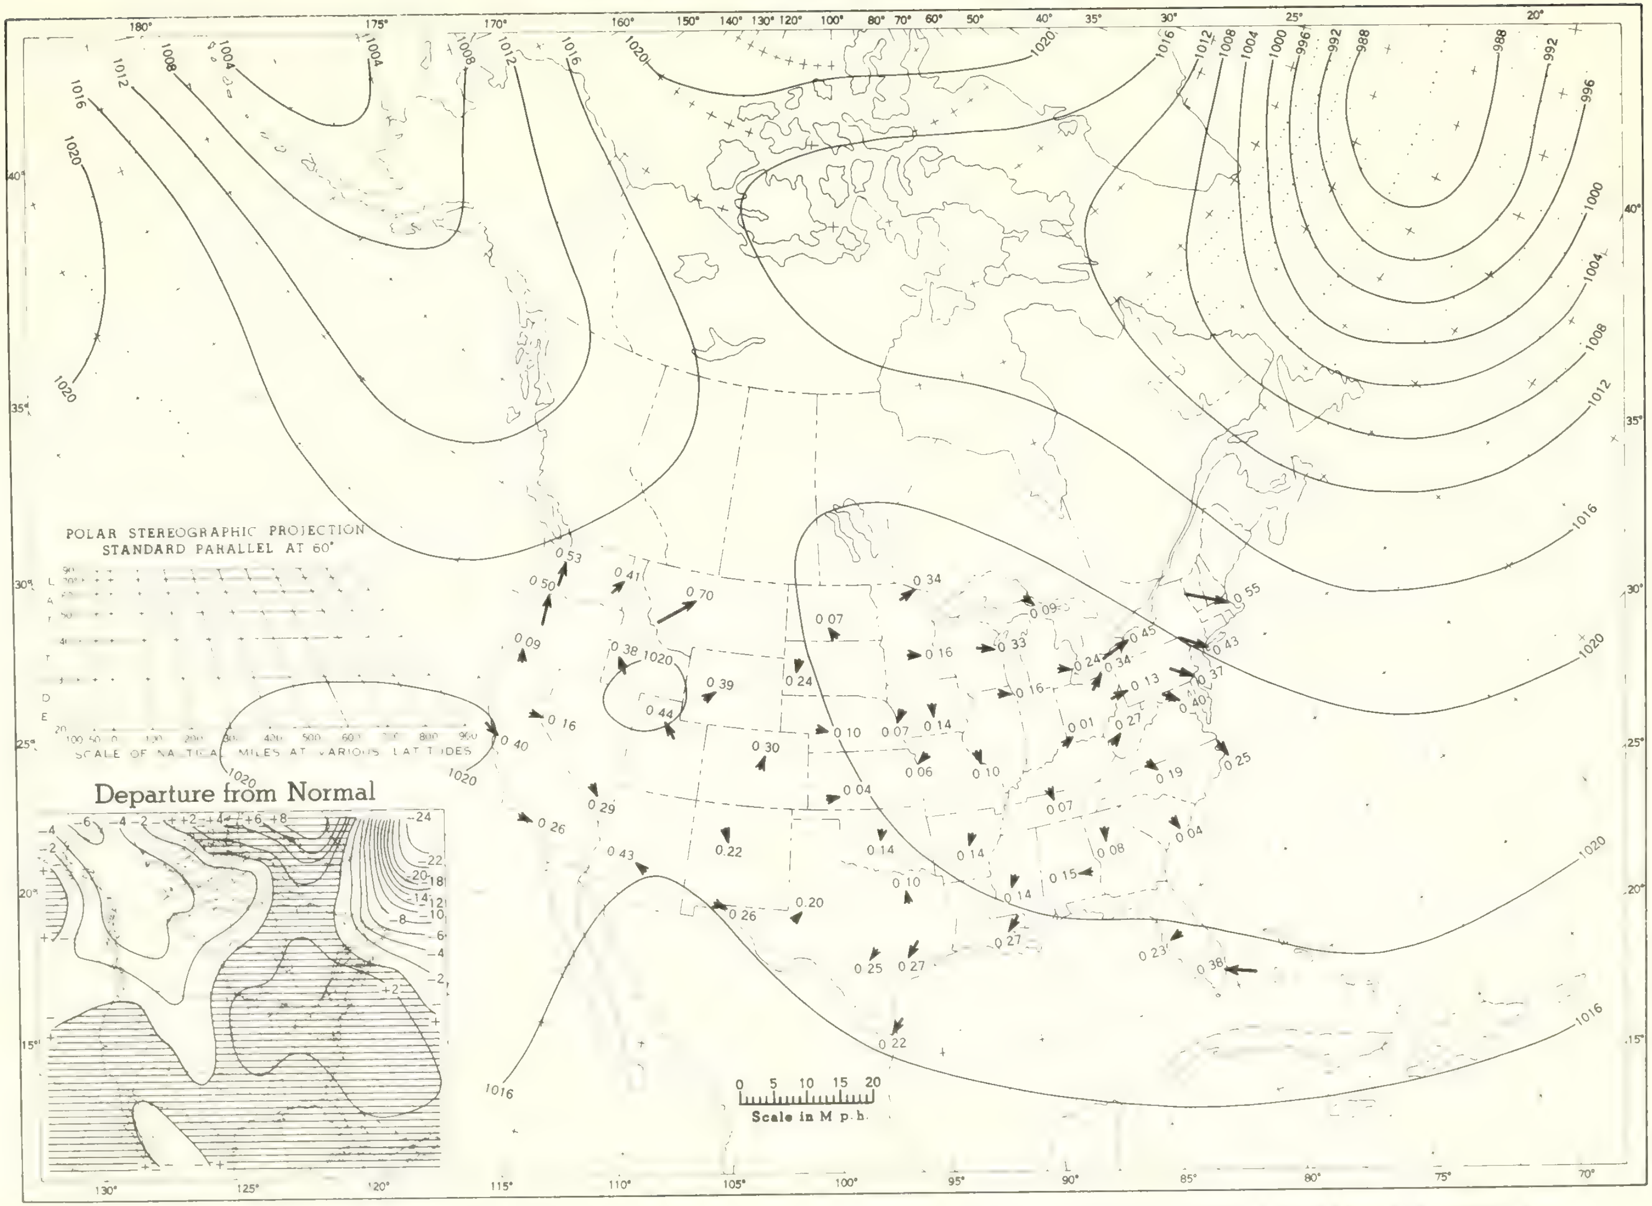
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, February 1966.



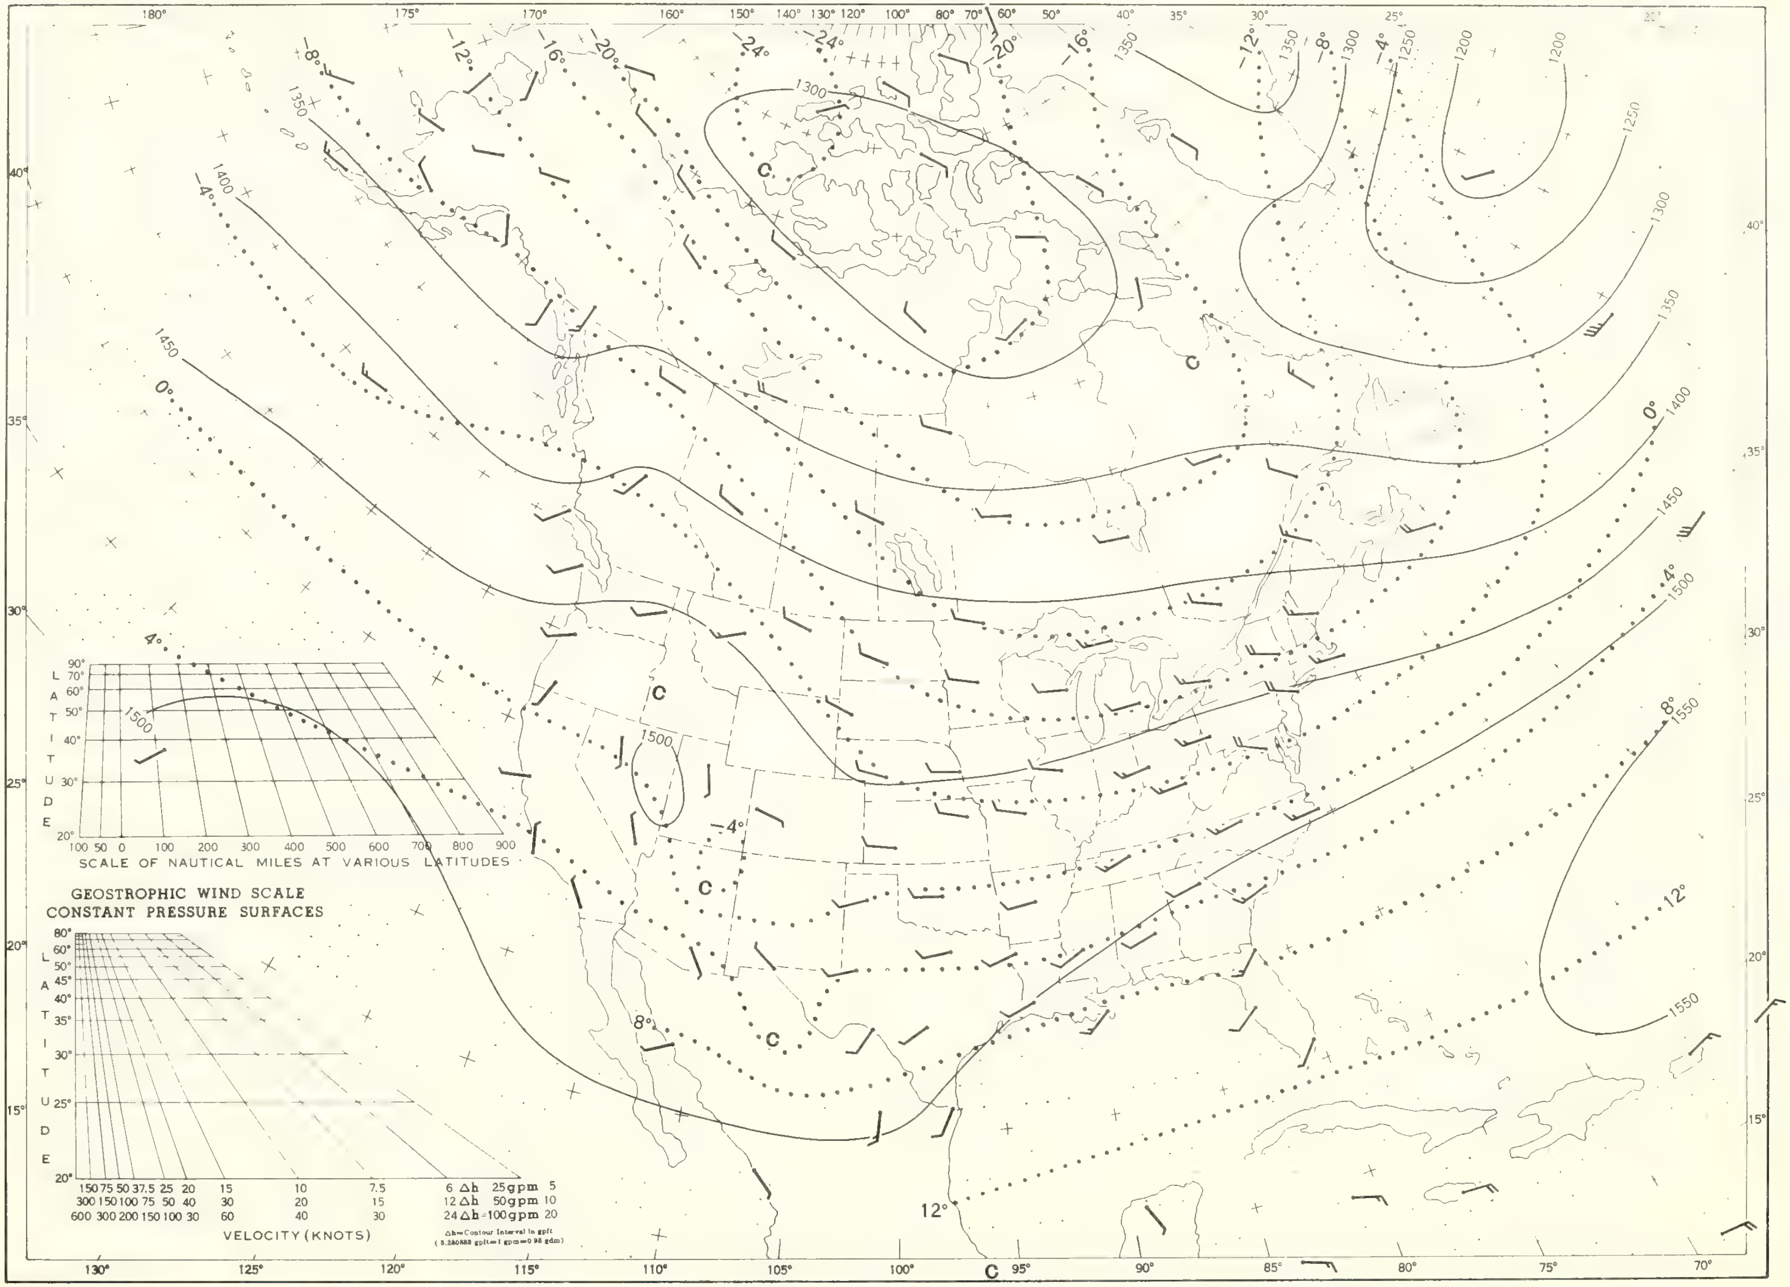
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, February 1966. Inset: Departure of Average Pressure (mb) from Normal, February 1966.



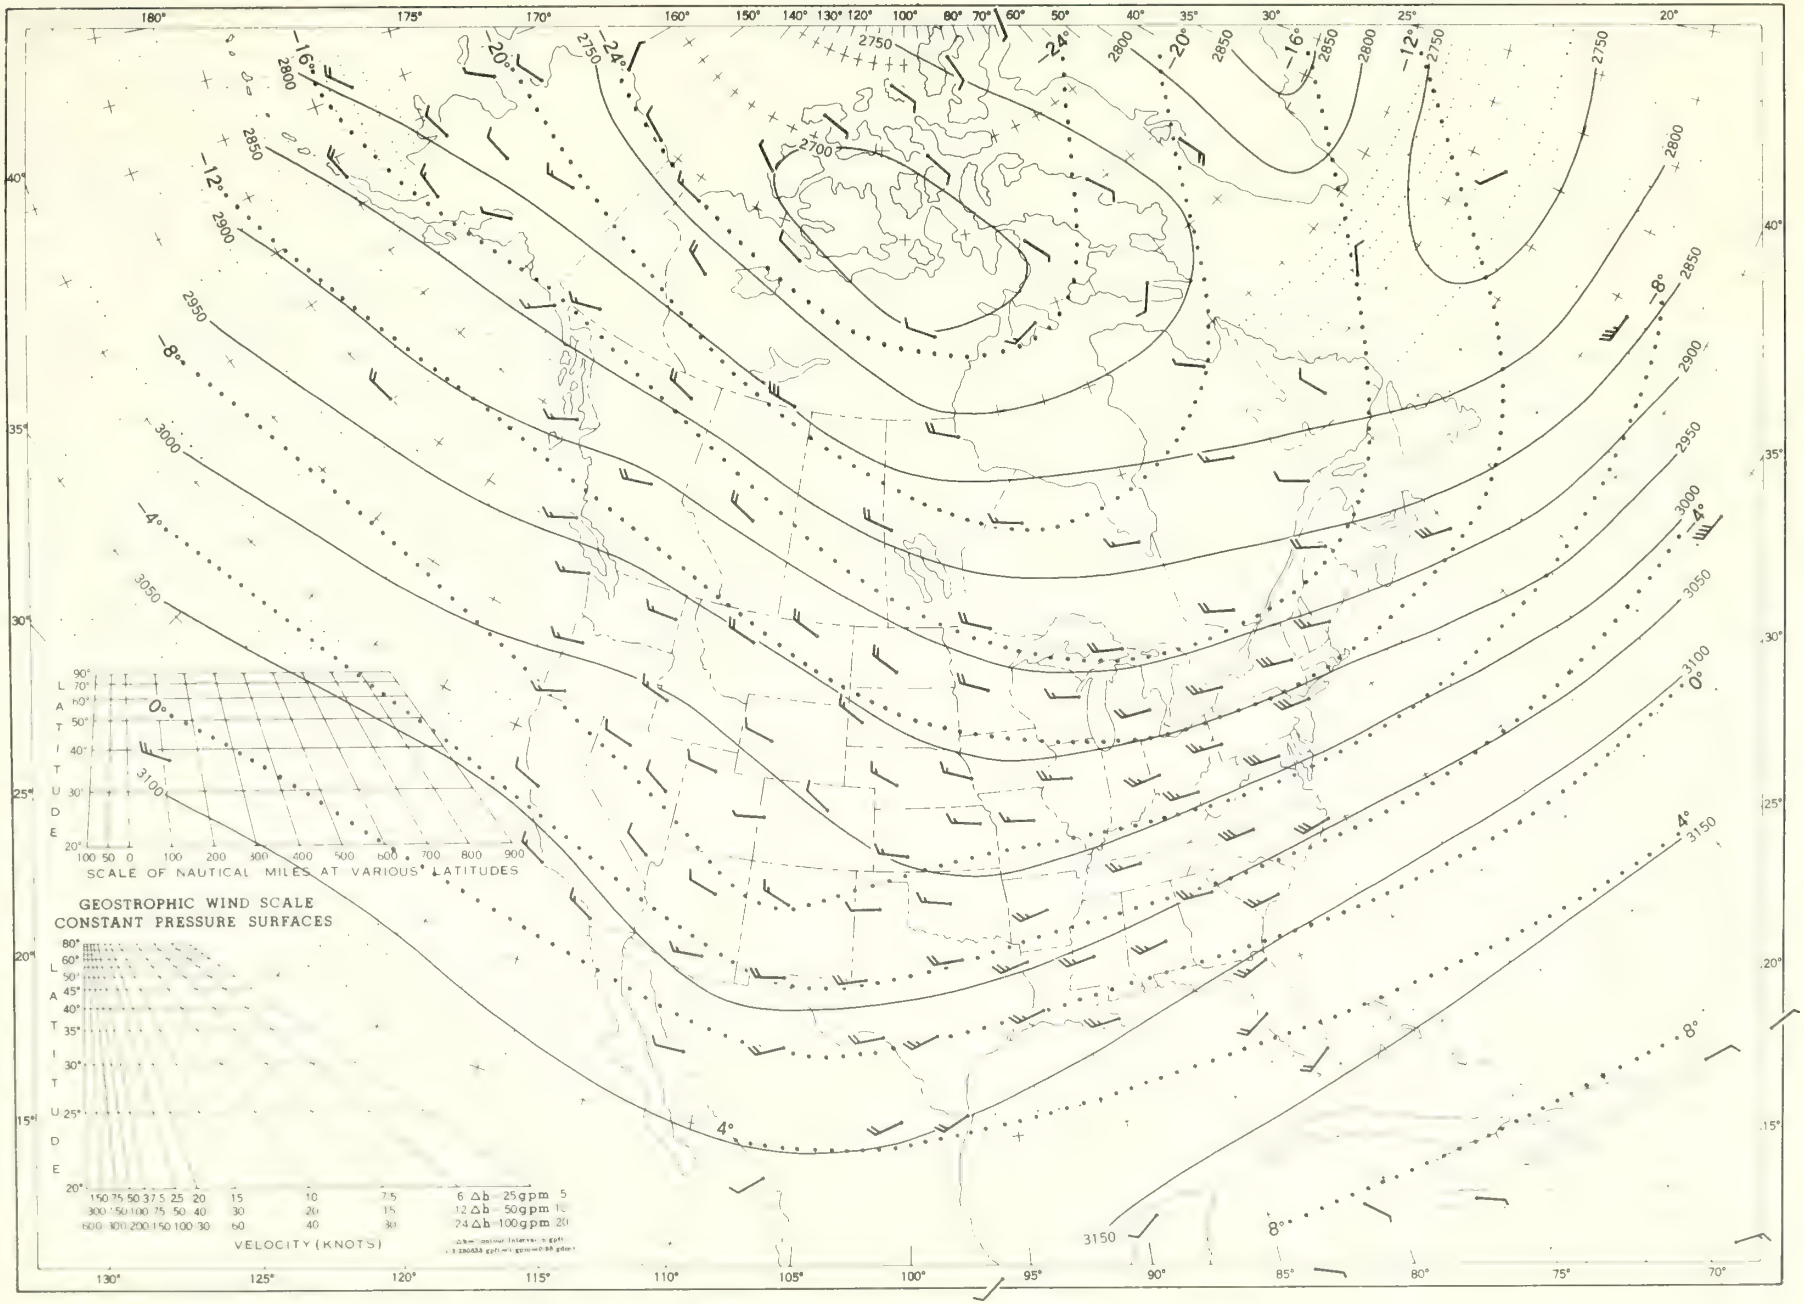
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed—average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, February 1966. Average Height and Temperature, and Resultant Winds.



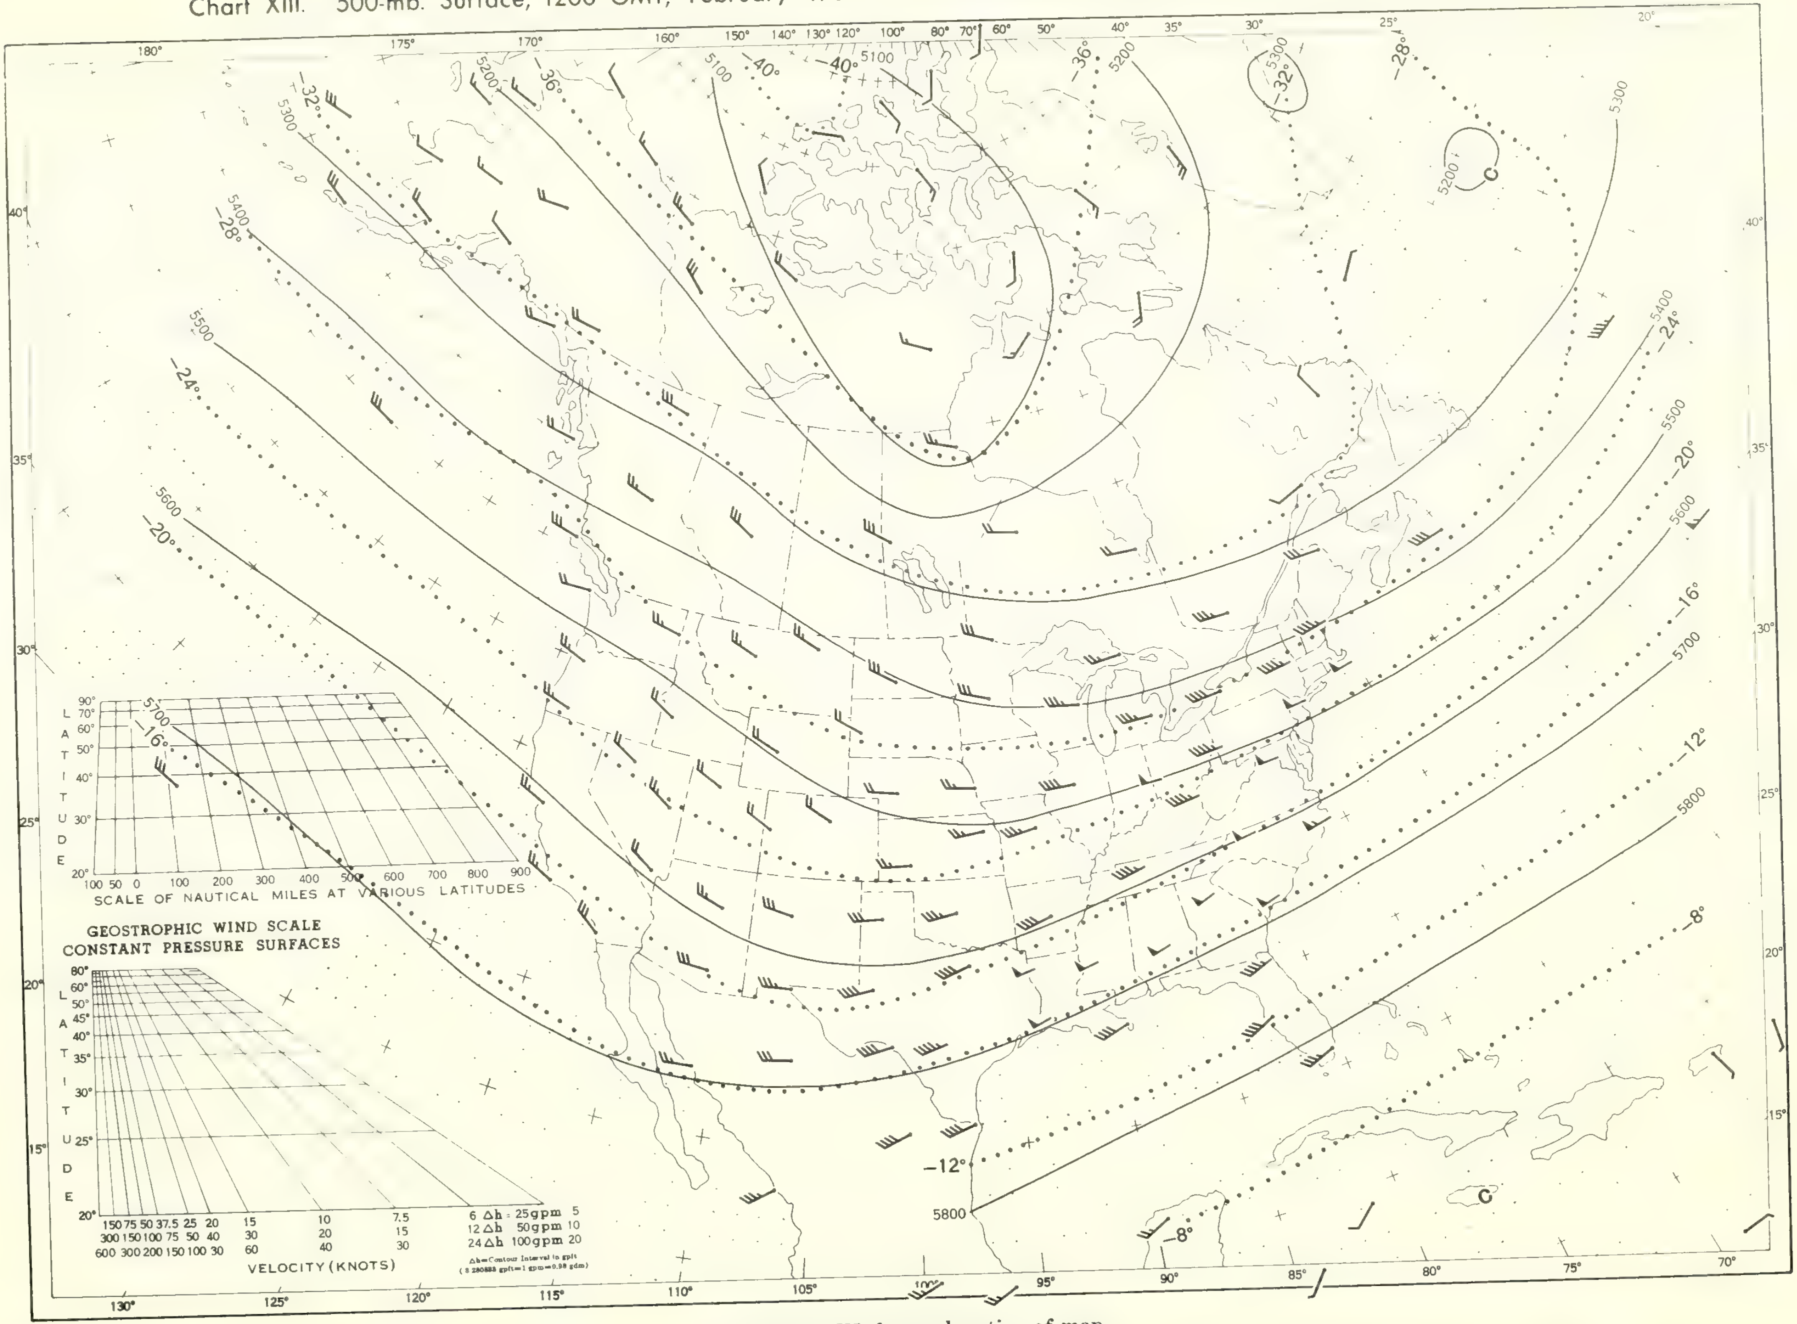
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, February 1966. Average Height and Temperature, and Resultant Winds.



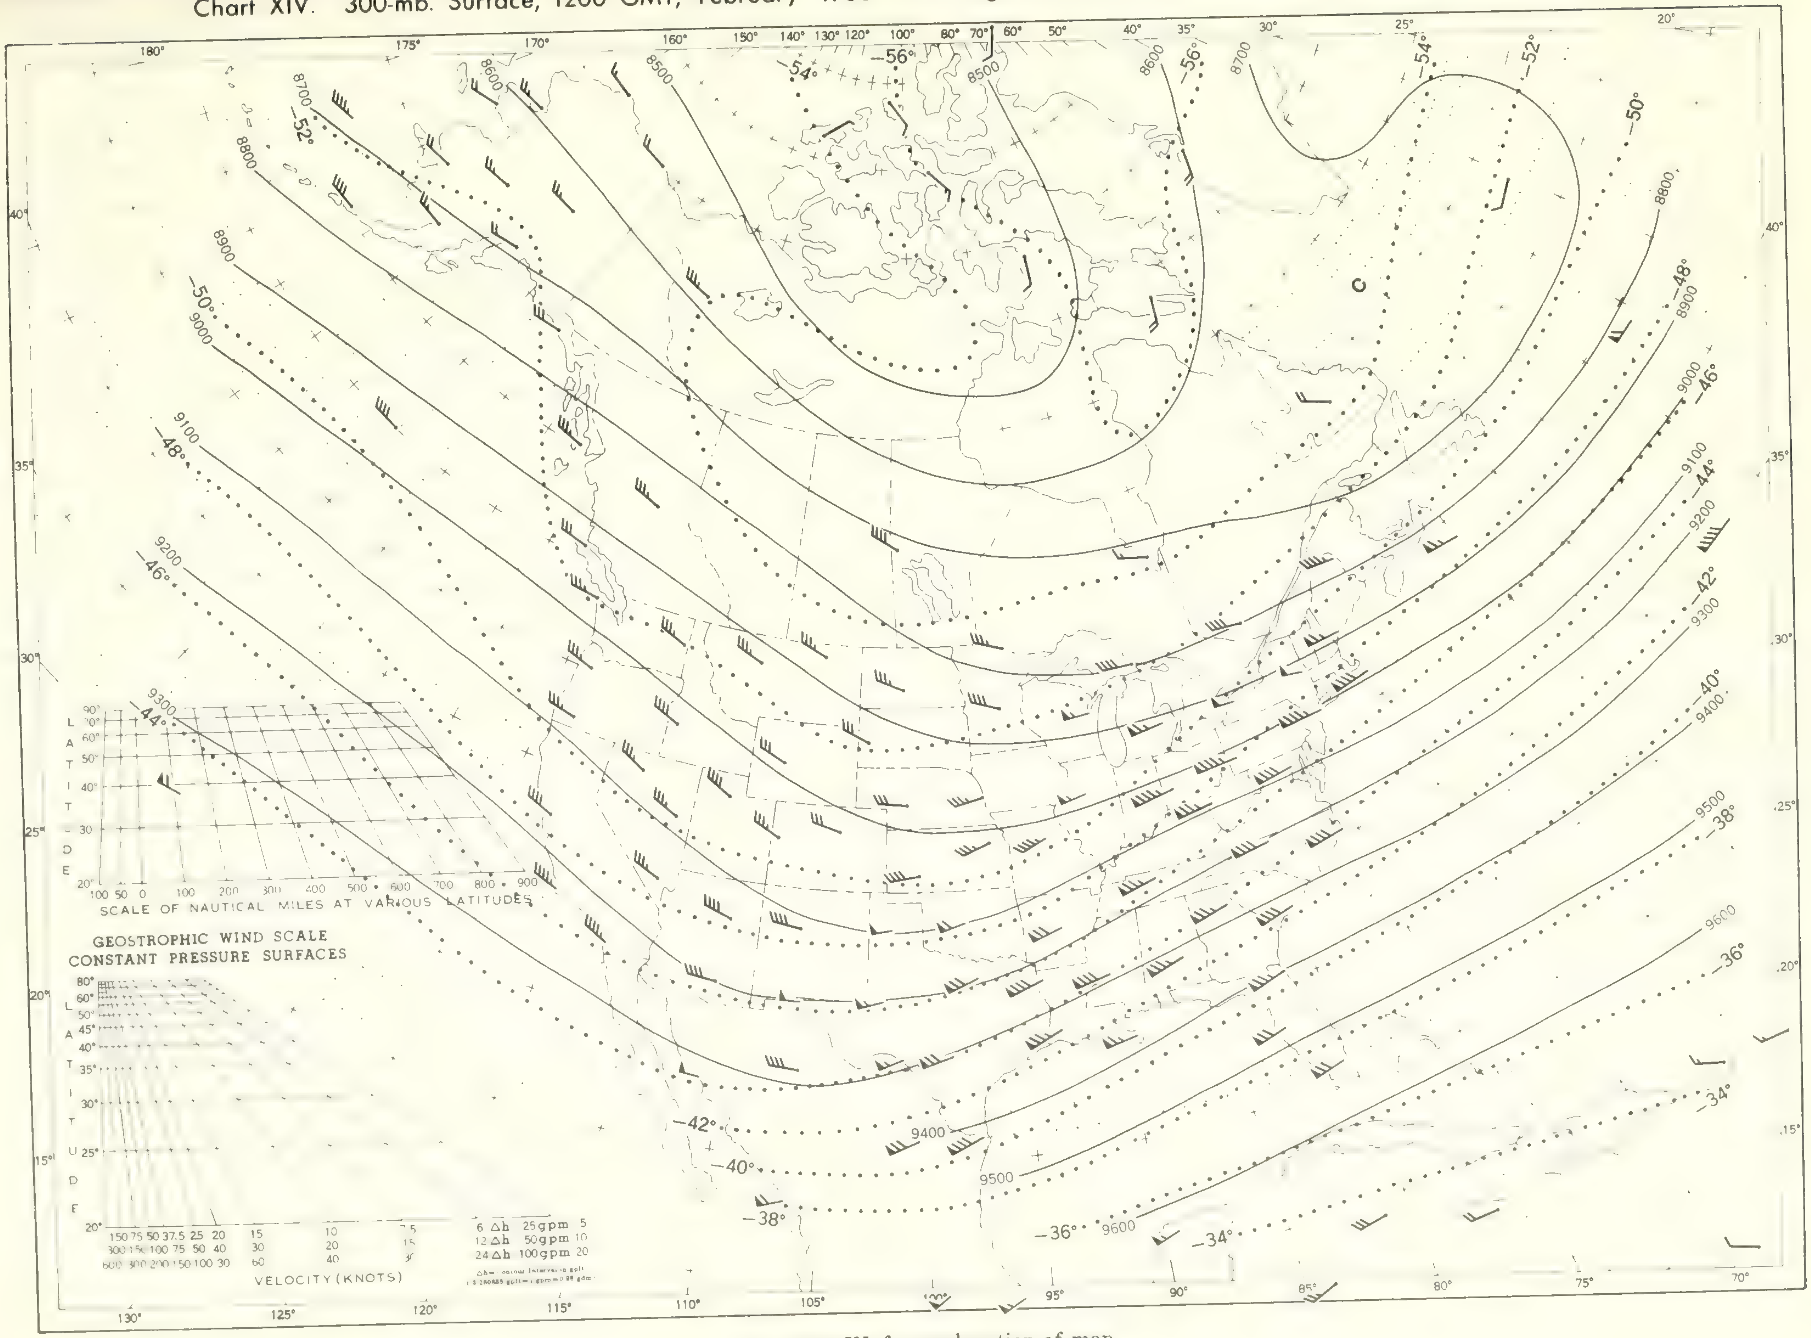
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, February 1966. Average Height and Temperature, and Resultant Winds.



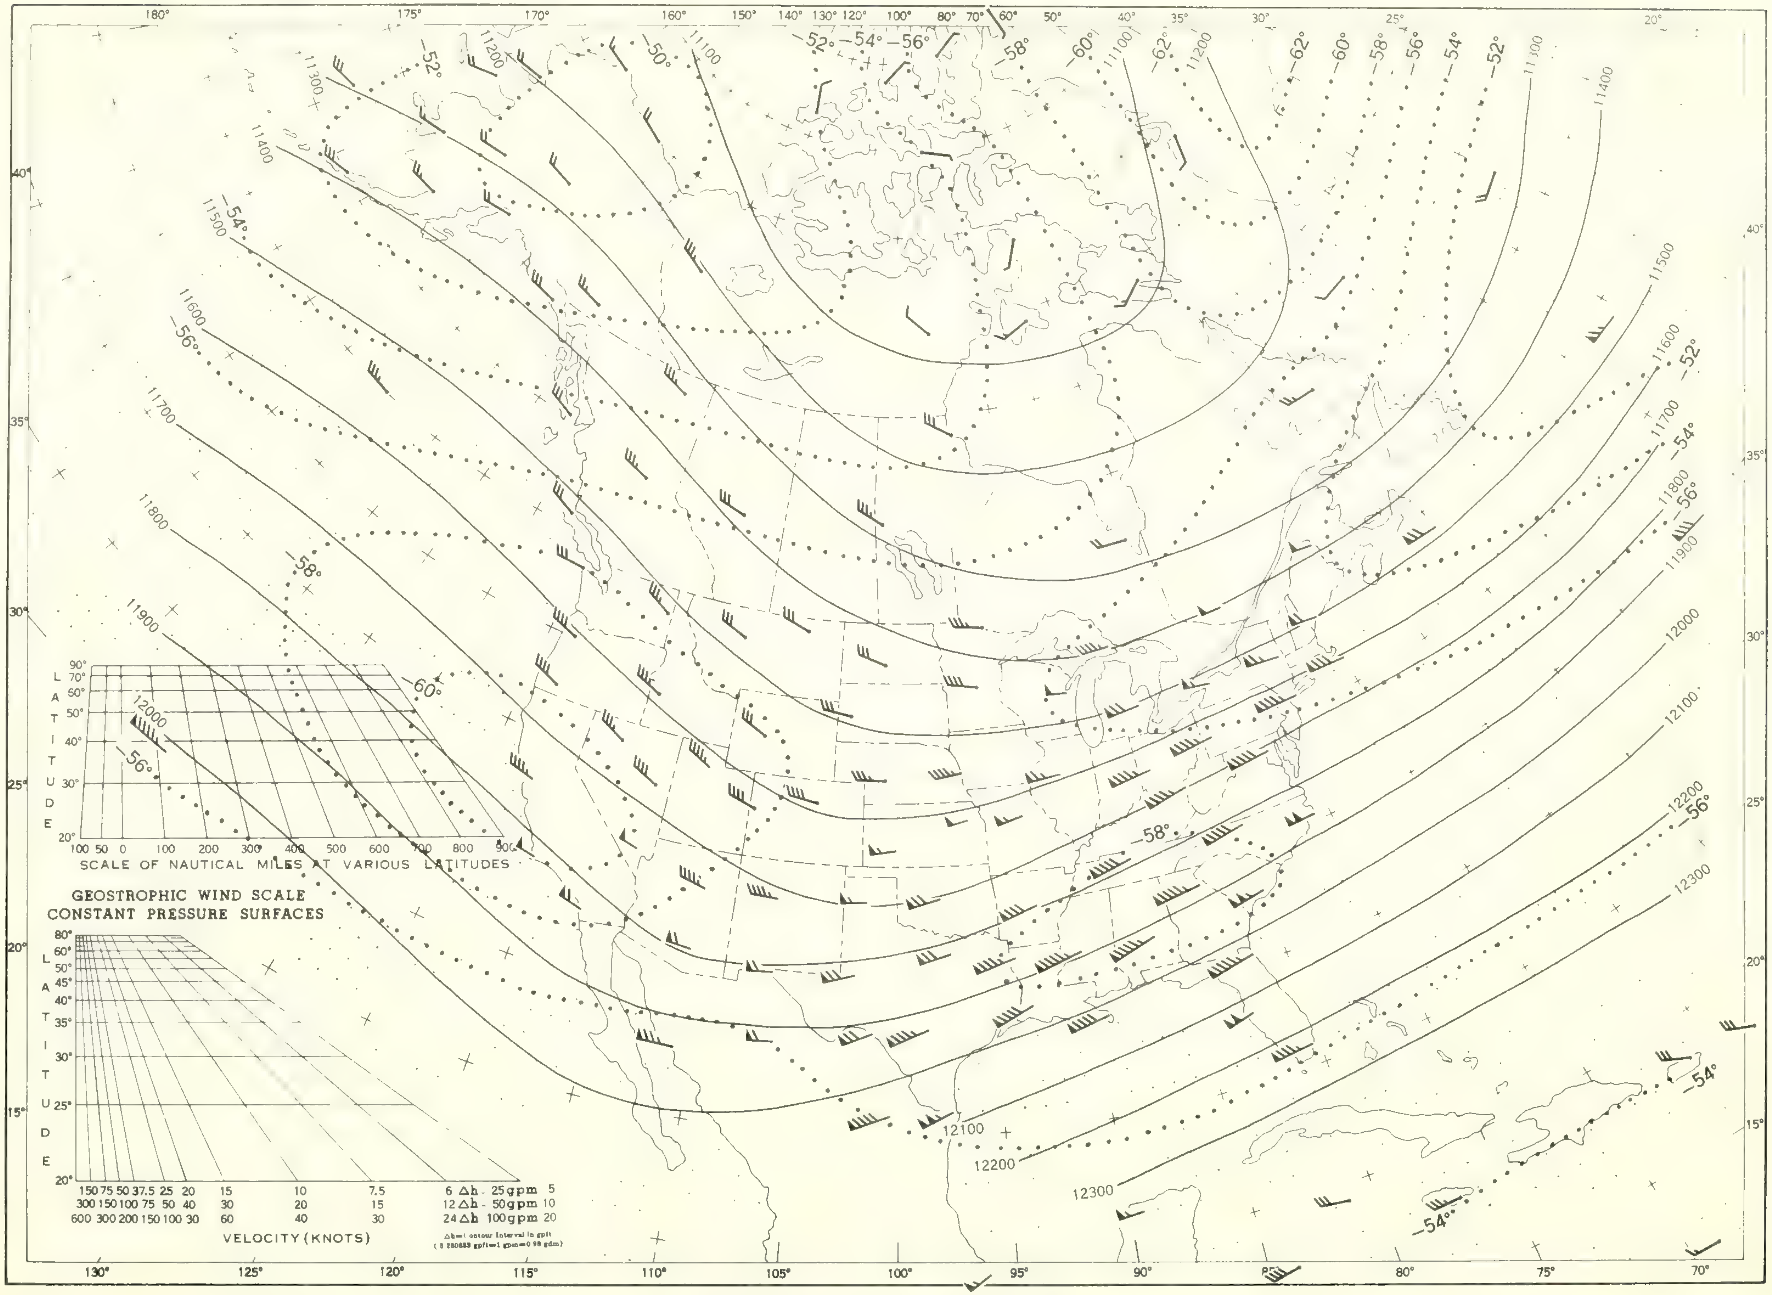
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, February 1966. Average Height and Temperature, and Resultant Winds.



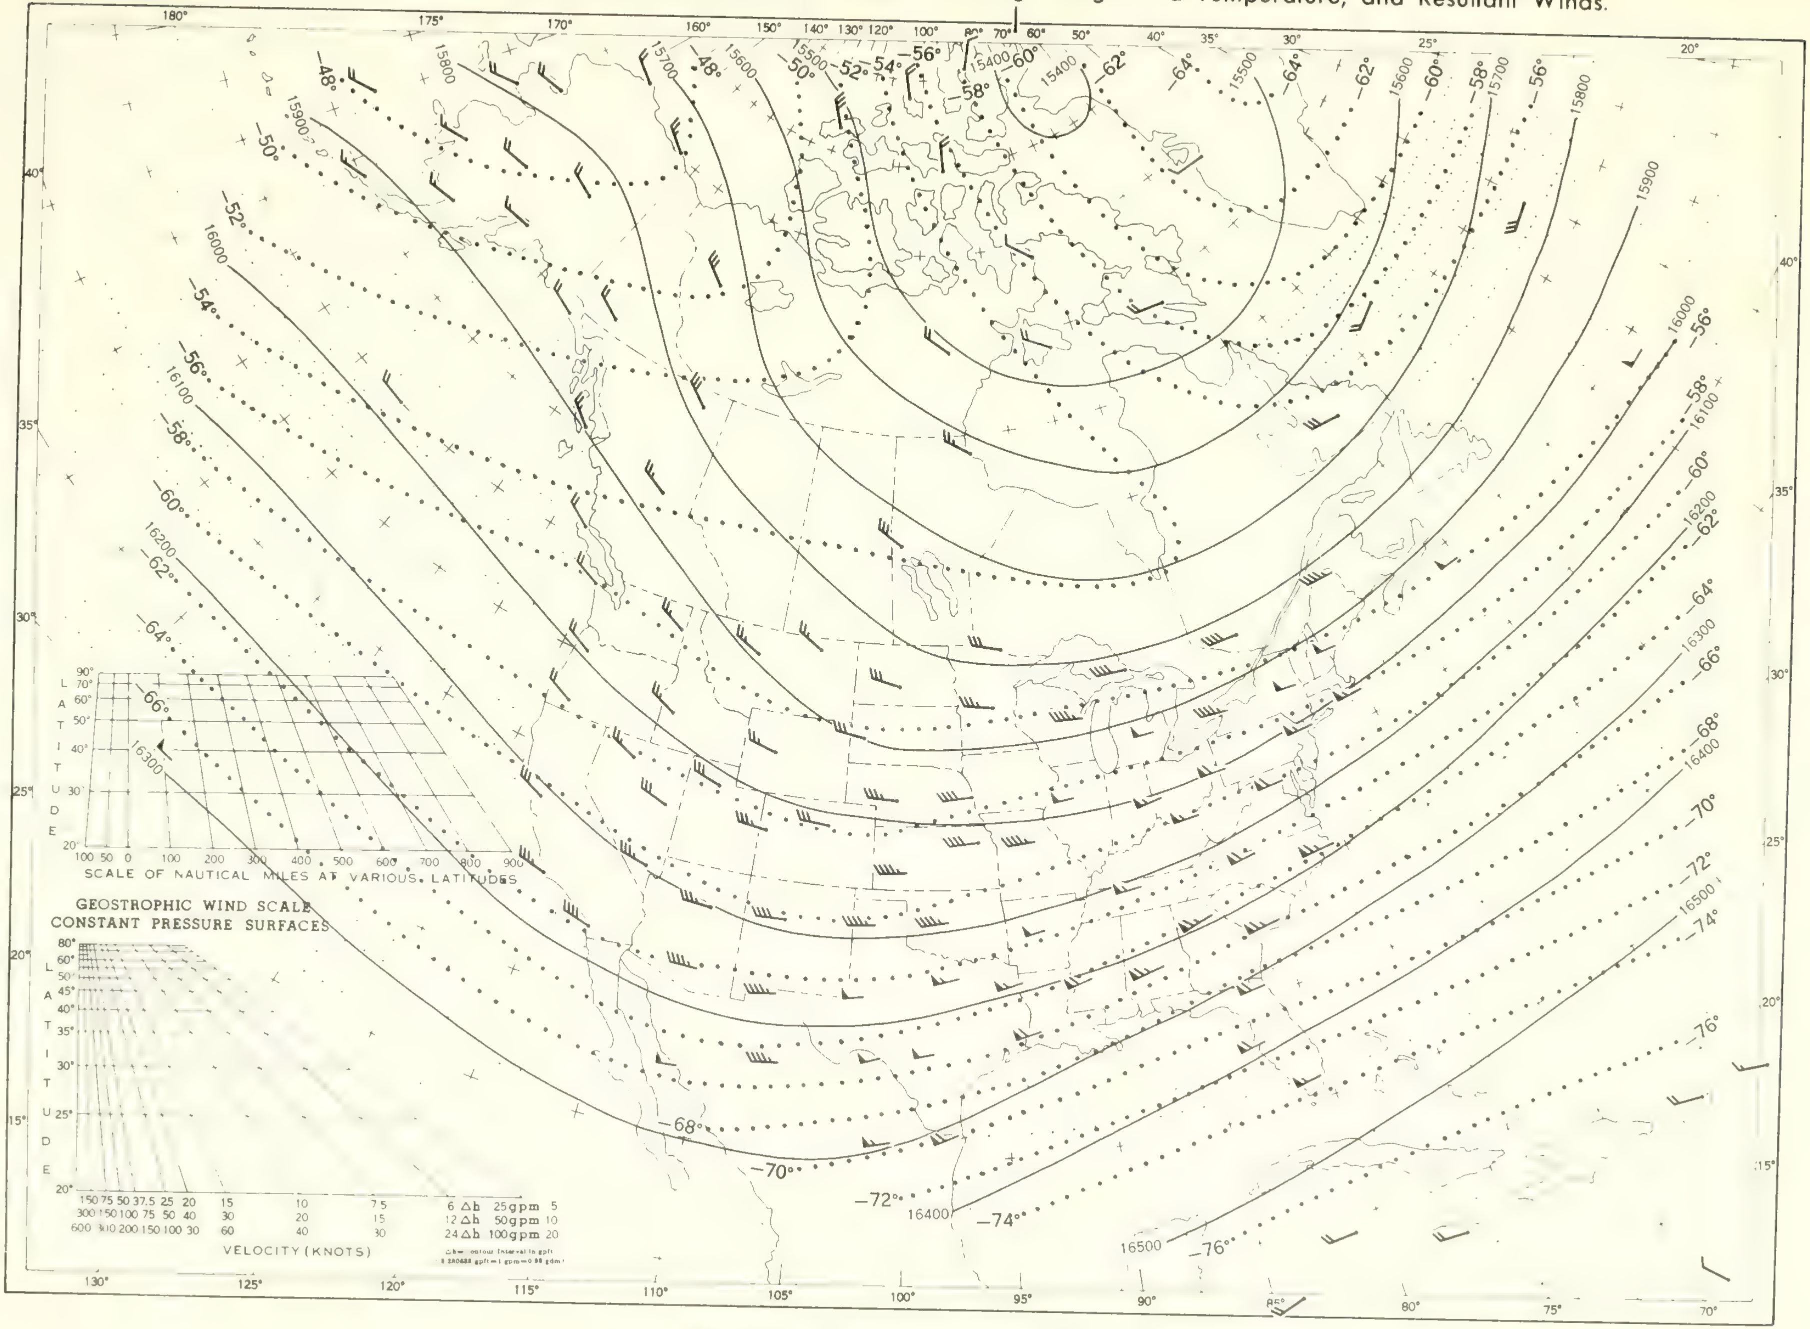
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, February 1966. Average Height and Temperature, and Resultant Winds.



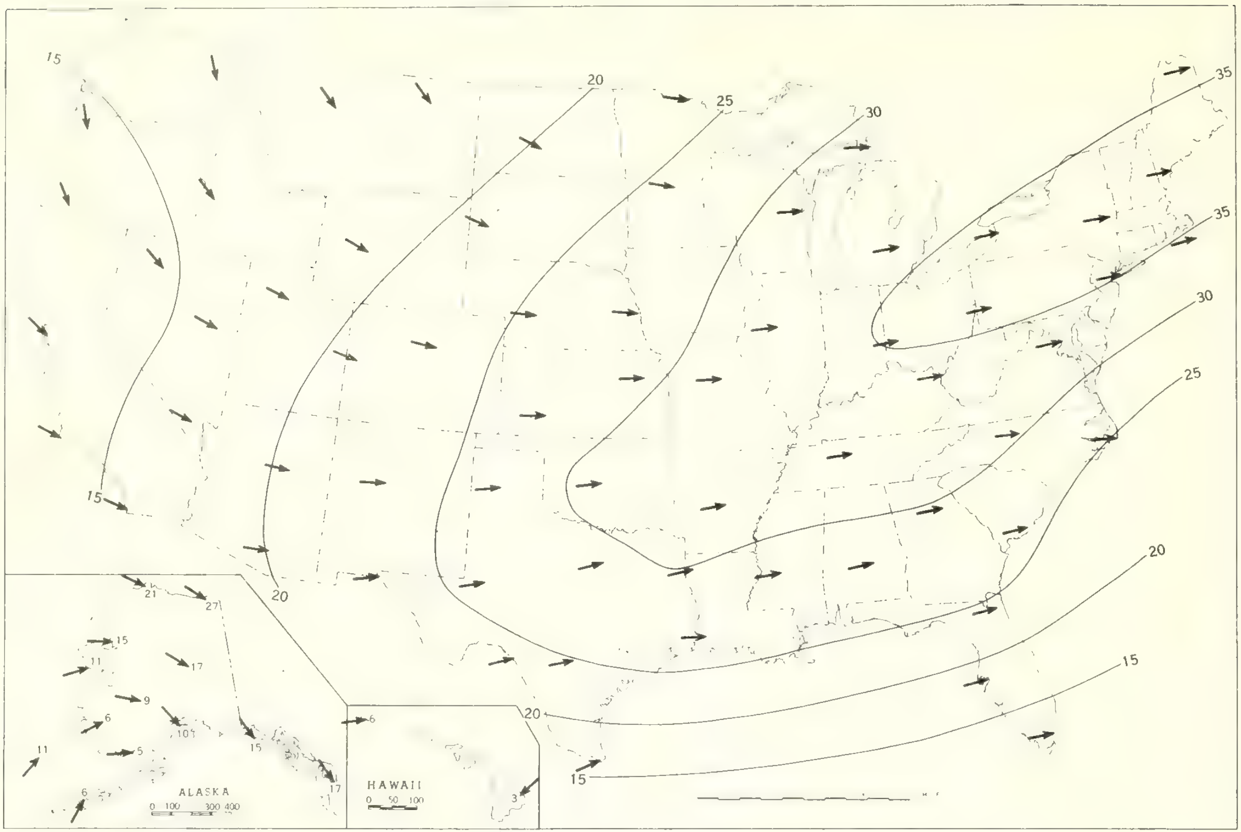
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, February 1966. Average Height and Temperature, and Resultant Winds.

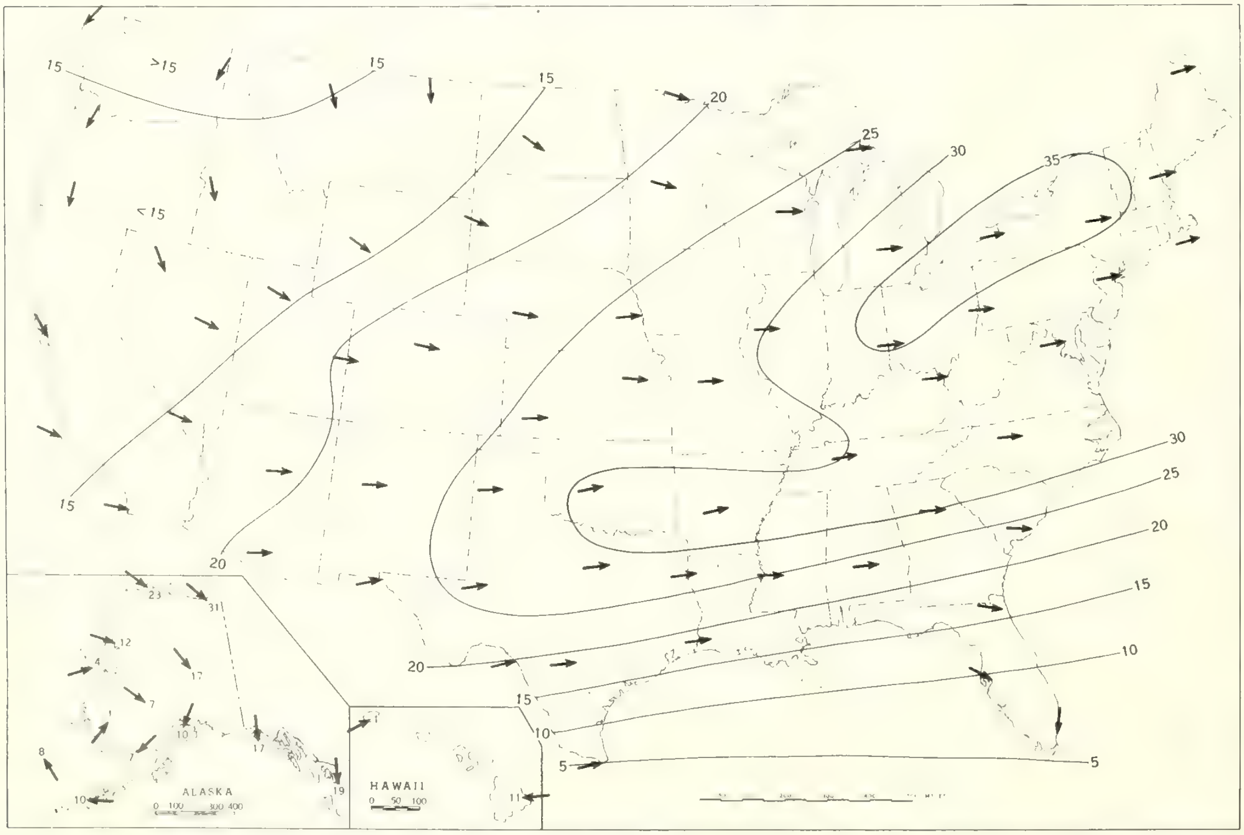


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, February 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, February 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 3 MARCH 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Two major blizzards in northern Great Plains.
2. Relatively dry month most areas.
3. Major tornado at Jackson, Mississippi.
4. Deficient snowfall much of Far West.

TEMPERATURE.--Temperatures for March averaged above normal nearly everywhere except normal to 3° below in parts of the Southeast. This was the reverse of February temperatures which averaged below normal nearly everywhere. At Grand Junction, Colo., this was the warmest March on record, and at Boston, Mass., and Minneapolis, Minn., the warmest in 20 years. Temperatures fluctuated widely during the month and occasionally reached record levels. Fresno, Calif., had a low of 26° on the 4th and a high of 89° on the 31st, both March records.

The first week was unusually cold in the western half of the 48 states. On the 4th, Phoenix, Ariz., recorded a late season low of 25°, and Flagstaff, Ariz., a record March low of -16°. Brownsville, Tex., reported frost on the 6th and Baton Rouge, La., and Orlando, Fla., on the 7th. In the northeastern quarter of the Nation the first week was as much as 12° above normal. The next 2 weeks were unseasonably warm except cold in the Gulf area the second week and in the Pacific Northwest the third week. Temperatures reached unseasonably high levels in the midcontinent area about midmonth. Valentine, Nebr., recorded an early season high of 79° on the 16th and Rockford, Ill., a March high of 73° on the 17th. The second week was the first warmer than normal such period in Colorado and New Mexico since January.

During the last 10 days temperatures rose steadily in the Far West but continued to fluctuate east of the Rockies. Freezing reached the Texas Panhandle on the 22d and 23d, damaging apricots and peaches. At Little Rock, Ark., the last freeze on the 25th was 9 days later than usual. Early season highs included 75° at Burns, Oreg., on the 29th, 74° at Helena, Mont., and 78° at Boise, Idaho, on the 30th. On the 31st a number of stations recorded their highest temperatures for March. Among these were Sacramento, Calif., 90°; Kalispell, Mont., 71°; and Reno, Nev., 83°. By the end of the month ice deterioration in the Great Lakes was ahead of normal. Nearly all the ice in Green Bay disappeared on March 22 and 23.

The month was among the coldest Marches on record in Alaska. In central Alaska, Fairbanks reported its second coldest March on record even with relatively warm weather the last 10 days.

PRECIPITATION.--With few exceptions, precipitation for March was below normal in the southern two-thirds of the 48 states. In the northern third monthly totals were unusually heavy from the Dakotas to Lake Michigan, slightly above normal in parts of the Pacific Northwest and northern portions of New York and New England, below normal in the rest of the area.

Precipitation in the Northeast totaled 2 inches or more in New York and New England, but was less than an inch in an area including southern New Jersey, Delaware, eastern Maryland, and parts of eastern and southern Virginia. In this latter area drought continued, but ground water levels rose in the rest of the Northeast and streamflow was above normal in Maine. Rainfall in the Northeast was well distributed through the month.

Precipitation generally ranged from 25 to 50 percent of normal from the western portion of the lower Great Plains to the Pacific coast and in the Ohio and lower Mississippi Valleys. This was the driest March in many years at numerous stations scattered across the Nation. This was the driest March since 1909 at Grand Junction, Colo., since 1910 at Lynchburg, Va., and Charleston, W. Va., since 1925 at Little Rock, Ark., and since 1941 at Evansville, Ind., and Memphis, Tenn.

In the Southeast, however, heavy rainfall ranging up to more than 4 inches during the first week continued lowland flooding along principal streams in Georgia and the Carolinas. Dry, windy weather in these States the rest of the month created a high fire hazard. During the last week hundreds of fires broke out.

From the Dakotas to Lake Michigan precipitation at many stations was 200 to more than 300 percent of normal and monthly totals ranged up to more than 4 inches. Much of this precipitation was in the form of snow which was particularly heavy during the first and last weeks. Nevertheless additional moisture from heavy snowmelt, with ice action a contributing factor, by the third week caused flooding in Minnesota and the Dakotas. Flooding continued in the Red River of the North Valley the rest of the month. In Upper Michigan, Marquette measured 4.46 inches of precipitation which equaled the greatest total for March there during the past 95 years.

SNOW.--In the Far West, where mountain snow accumulation is an important factor in determining warm season water supplies, March snowfall was below average in nearly all sections except near or above in parts of the Pacific Northwest. In addition, above normal temperatures caused more rapid melting of the snow than is usual for March and the snowpack declined in most areas, generally ranging from 60 to 80 percent of normal on April 1. By the end of the month the ground was bare at lower elevations.

At the beginning of March the northeastern highlands were covered with snow, ranging up to 3 feet deep and a light cover reached from Wisconsin and Upper Michigan to the Rockies. The ground was bare from eastern Pennsylvania through Ohio, Indiana, and Lower Michigan.

The first of two major snowstorms east of the Rockies occurred in northern areas the first week as a storm moved eastward from the northern Rockies. Two records were set at Bismarck, N. Dak., during this storm-- 15.5 inches in 24 hours on the 3d and 22.4 inches for a 3-day storm in March. Up to 2 feet of snow fell in northern Minnesota, up to 20 inches or more in eastern and south-central North Dakota, and up to 31 inches in north-central South Dakota.

During the fourth week another storm moved northeastward from the central Rockies. Six inches of snow fell in Kansas and a foot or more from northeastern Nebraska to Upper Michigan. Much of this snow soon melted.

By the end of the month the snow cover in north-central areas had retreated from northeastern North Dakota to areas bordering Lake Superior, and in the Northeast to the St. Lawrence Valley and northern portions of New York and New England.

Marquette, Mich., measured 31.5 inches of snow for the month, the most since 1923, while Portland, Maine, had the least since 1946.

SEVERE STORMS.--Tornadoes and blizzards accounted for most storm losses during March 1966. During a stormy period March 2-5, one of the most severe blizzards of record swept across the northern Great Plains. This blizzard was notable for long duration, heavy snowfall, and strong winds. Wind gusts of 101 m.p.h. were reported at Broken Bow, Nebr., and 130 m.p.h. at the Air Force Station at Gettysburg, S. Dak. Several stations measured more than 30 inches of snow on the level on the 5th and drifts ranged up to 20 feet high. During the storm 35 inches of snow fell at Mobridge, N. Dak., and a depth of 34 inches was reported on the 5th. During the height of the storm on the 3d at Bismarck, N. Dak., visibility was zero for 11 consecutive hours - from 2 a.m. to 1 p.m. The storm was blamed for many deaths and livestock losses of many millions. Power failures occurred over wide areas for as long as 3 days in some cases, and traffic was paralyzed. As the blizzard raged in the northern Great Plains on the 3d, a series of tornadoes left paths of destruction in Mississippi and Alabama. Heaviest losses occurred in suburban Jackson, Miss., where a shopping center was leveled and power and communications were knocked out. At least 57 persons were killed, over 400 injured, and property losses ammounted to several million. This was the worst tornado disaster in Mississippi since 1936.

On the 22d and 23d the second blizzard of the month swept across the northern Great Plains. Up to a foot of snow drifted by hurricane-force winds forced schools and businesses to close and blocked highways. Numerous deaths were blamed on the storm.

CONDENSED CLIMATOLOGICAL SUMMARY

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - **Station Pressure**" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

°	Includes crop damage
C	Crop damage
D	Dust-Devils
U	Unknown
R	Rain
H	Heavy rain and floods

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
∅ For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

MARCH 1966

Elmer R. Nelson
Office of Hydrology

Severe flooding began in the Red River of the North Basin during March, which continued into April and May. Considerable property damage occurred along the smaller tributaries during March. The main stem of the Mississippi reached a record high stage at Fort Ripley, Minn., due to an icejam. Flooding elsewhere in the Upper Mississippi Basin was mostly minor in comparison with the spring of 1965.

In the East Gulf of Mexico Drainage, the Flint River in Georgia reached its highest stage in 18 to 36 years at various points. The Apalachicola River at Blountstown, Fla., reached its second highest stage of record.

HUDSON BAY DRAINAGE

Red River of the North Basin.--Flooding began along the main stem of the Red River of the North at Wahpeton, N. Dak., on March 14. The crest of 13.9 feet on the 16th was the seventh highest stage of record. It was 0.4 foot lower than the 14.3 feet crest reported on April 11, 1965. As the main stem was cresting at Wahpeton, it began overflowing its banks at Fargo, N. Dak. The following day on March 17, the Sheyenne River went out of its banks at West Fargo, N. Dak. Flooding along the Red River of the North extended to Halstad, Minn., on the 20th and to Grand Forks, N. Dak., by the 21st. The Sheyenne River crested at West Fargo on the 22d at a stage of 20.4 feet, (flood stage 16 feet). This was 0.35 foot lower than in April 1965. The main stem crested at Fargo on the 23d at a stage of 30.1 feet. This was 13.1 feet above flood stage and 0.45 foot lower than in April 1965. This was the seventh highest stage of record. A crest of 35.5 feet occurred at Halstad, Minn., on March 27, 1966. This was 11.5 feet above flood stage and slightly higher (0.1 foot) than in April 1965. The Red of the North began overflowing at Drayton, N. Dak., on the 29th and on the Red Lake River at Crookston, Minn., on the 31st. The Sheyenne, Red Lake, and the Red River of the North were still in flood at the end of March except the Red of the North at Wahpeton, N. Dak., where it receded within its banks on the 21st. At Pembina, N. Dak., the river had risen to within 4 feet of flood stage by midnight of March 31.

Antecedent conditions were favorable during the fall 1965 for spring flooding due to abundant precipitation. Another factor favoring severe flooding was the heavy accumulation of snow during the winter months over the central and northern parts of the basin. Heavy wet snow during the first week in March increased the flood potential. The total water equivalent of snow on the ground after this storm ranged from 2 inches over the extreme southern portion of the valley to over 6 inches over the northern portion. Above normal temperatures during the month caused an early rapid runoff and major flooding.

Damage to city property and farmlands was extensive, especially along the Sheyenne River near West Fargo and on the Red River from Fargo northward. Flooding occurred on some of the smaller tributaries with considerable damage to property.

ST. LAWRENCE DRAINAGE

Lake Ontario.--Minor flooding occurred on Black Creek at Churchville, N. Y. on the 6th. No damage was reported.

ATLANTIC SLOPE DRAINAGE

Minor flooding occurred on the James River at Richmond, Va., on the 2d. This overflow was due to heavy rain on February 28 plus snowmelt. The rainfall averaged from about 1 inch to 1.75 inches. Headwater stages reached crests well below bankfull level on March 1. Rises in the upper James reached about half bankfull. No damage was reported.

Slight overflow occurred on the Chemung River at Chemung, N. Y., on the morning of the 6th. No damage resulted.

The Neuse River at Goldsboro, N. C., went out of its banks on February 18 due to heavy rain on February 14 and snowmelt. Additional rain on February 24 and 28 caused the stream to rise above flood level from Neuse to Kinston, N. C. The crests during March were 3 to 4 feet higher than in February and ranged from 4 to more than 7 feet above bankfull level. Flooding on the Roanoke, Tar, and Cape Fear Rivers was due to the heavy rains on February 28. Additional heavy rain on March 4 created another surge at upstream locations and piled up more water at downstream points. The upper and middle Cape Fear River reached from a foot to 7 feet in flood while the lower portion crested 11 to 15 feet above flood stage. No damage resulted from the overflows.

Precipitation of 1 to 3 inches on February 28 followed by generally heavy rains during the first 5 days of March caused sharp rises and flooding along streams in South Carolina. In some cases it was the heaviest flooding in many years. Losses were heaviest along the Congaree below Columbia, S. C., on the Wateree below Camden, and along the lower Santee below Lake Marion. Lumber operations along the Congaree, the Wateree, the lower Santee, and middle Pee Dee Rivers had to be suspended for several weeks.

The Savannah and Ogeechee Rivers in Georgia were in flood in the beginning of March. Additional flooding occurred on the Savannah at Augusta on the 6th and on the Ogeechee at Midville, Ga., on the 5-10th. Flooding continued at downstream points most of the month.

The Ocmulgee River at Lumber City, Ga., went above flood stage on February 23 and continued in flood until March 17. In the upper reach, at and above Hawkinsville, Ga., the stream went out of its banks on the 5th and continued in flood at Macon, Ga., until the 7th and at Hawkinsville, Ga., until the 10th. The Oconee River in Georgia rose 4 to 6 feet above flood level between the 4th and 17th. The Altamaha River at Charlotte, Ga., was in flood from February 21 to March 22. There were two crests, the first on February 26 was 6.2 feet above flood stage. The second on March 11 was nearly 9 feet above flood stage. Minor flooding occurred upstream at Waycross, Ga., between the 6th and 12th. The initial damage from flooding on the morning of the 3d occurred along small and generally unnamed streams or dry washes. Many roads had washed out sections and some low-lying portions of Warner Robins, Ga., was flooded, necessitating the evacuation of a trailer court. More rain on the 4th and 5th caused Big Indian Creek at Perry, Ga., to overflow and pollute the city reservoir. Flooding was generally light along the Ocmulgee and Oconee Rivers except in the extreme lower portions.

EAST GULF OF MEXICO DRAINAGE

The heavy rains of early March caused the Suwannee River in Florida to exceed flood stage by 1 to 3 feet between the 17th and 25th. The Alapaha River at Statenville, Ga., exceeded flood stage by over 3 feet on the 14th. Damages from the flooding were mostly to agricultural areas, fishing camps, and sawmills. The total losses in the Suwannee system were estimated at $50,000.

Heavy rains on the last 2 days of February and again on the 3d to the 5th of March produced high flooding on the middle and lower Flint Rivers in Georgia and on the Apalachicola River in Florida. Flooding on the Chattahoochee River occurred in the lower portion from Fort Gaines, Ga., downstream. Excessively heavy rains caused overflows in parts of Columbus directly from rainfall, resulting in considerable damages and the necessity of evacuating some people out of the low-lying flooded areas. The Chattahoochee River in the Fort Gaines, Ga., and Columbia, Ala., areas, and below, rose 5 to 10 feet above flood stage. The Flint River at Albany, Ga., crested 14.4 feet above flood stage on the 7th. This was the highest water at Albany since March 1929 when it reached the same stage of 34.4 feet. At Newton, Ga., a crest of 34.9 feet (flood stage 24 feet) on the 9th inundated most of the town. In the lower part of the Flint River at Bainbridge, Ga., the crest was 31.2 feet or almost 6 feet above flood stage. This was the greatest rise at Bainbridge since April 1948. Jim Woodruff Dam, at the confluence of the Chattahoochee and Flint Rivers, had a tailwater crest of 72.4 feet, or about 6.5 feet above flood stage. This was the highest stage at this location since the dam began operation in 1958. The Apalachicola River at Blountstown, Fla., rose to a crest of 24.4 feet, or 9.4 feet above flood stage, on the 9th. This was the second highest crest of record since 1929 when it reached a record stage of 28.6 feet. The total damages along the Chattahoochee, Flint, and Apalachicola are estimated at $1.3 million.

Heavy rains falling mainly on the 3d of March resulted in moderate flooding on the Alabama River and on the upper Coosa River in Alabama. Minor flooding occurred on the Conecuh River around Brewton, Ala., and on the Choctawhatchee River at Caryville, Fla. Rainfall exceeded 3 inches except in the Cahaha Basin which averaged about 2 inches. Conditions were favorable for maximum runoff due to frequent and heavy rains the preceding month. The flooding affected farm- and pastureland, making it necessary to move livestock from lowland areas. Work in the forests and woodlands was curtailed.

At the beginning of March, the Warrior and Tombigbee Rivers were falling at all stations and were within their banks at all points except at Jackson Lock and Dam, Ala., where it fell below on the 2d. Moderate rains on the 2d and 3d caused a slight overflow on the Black Warrior at Warrior Lock and Dam, Ala., on the 6th and 7th. No damage resulted from these overflows.

Heavy rain between February 10 and 17 caused flooding along the entire length of the Pearl River in Mississippi and Louisiana. The flooding continued at and below Jackson, Miss., the entire month of March. The crests between February 17 and 19 ranged from 5.5 feet above flood stage at Bogalusa and Pearl River, La., to 13 feet above flood stage at Jackson, Miss. The flood damages along the Pearl during March totaled about $159,000.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--The severe snowstorm of March 2 - 5 deposited heavy amounts of new snow over the headwaters of the Mississippi River. The water equivalent of the new and old snow on March 8 ranged from 6 to 8 inches over an area bounded by Bemidji, Wadena, Duluth, and Hibbing, Minn. The new snow ranged in depth from near 10 to 31 inches at Park Rapids, Minn. Moderate to heavy rainfall occurred over northeastern Iowa, Wisconsin, and central and southeastern Minnesota. The last week of February was warm, thawing the ground sufficiently so that some of the rain was absorbed. Freezing temperatures followed the snow and rain and helped to check the surface runoff.

The South Branch Zumbro River at Rochester, Minn., went out of its banks on March 3. The crest on the 4th was 3.1 feet above flood stage. The main stem of the Zumbro went above flood stage on the same date at Zumbro Falls and Theilman, Minn. The Cottonwood River near New Ulm, Minn., and the Root River at Hokah, Minn., also rose above flood stage on the 4th. The crests were all affected by ice action. Minor flooding occurred on the Crow River at Delano, Minn., on the 10-14th. The spring snowmelt rise proceeded eastward and southward through the middle of March. The Redwood River near Redwood Falls, Minn., exceeded flood stage by 5.4 feet on the 15th. Other streams in southeastern Minnesota overflowed their banks, but did not reach the proportions of March 1965.

An icejam on the Mississippi at Fort Ripley, Minn., caused a record stage of 14.25 feet at this point on the 23d. Flood stage is 10 feet. The previous record stage of 13.55 feet occurred on April 16, 1965. Temporary icejams occurred at Monticello, Elk River, and just north of Minneapolis, Minn., between the 13th and 19th. Minor flooding occurred at Wabasha, Minn., on the 24th and 25th. The only other flooding along the main stem occurred at Keithsburg, Ill., on March 29 to April 8.

Flood damages were at a minimum and of no consequence.

Missouri Basin.--The snow cover on March 1 ranged from 2 to 4 inches from the Black Hills to near Mobridge, S. Dak., and was mostly in drifts from central South Dakota to northwest Iowa. The blizzard of March 2-5 left considerable snow over the Missouri and James River basins. It covered most of the Dakotas and northern Nebraska. Snow depths ranged from 1 to 3 feet with a water equivalent of 3 to 6 inches. Snow drifts ranged as high as 10 feet with considerable bare ground in between.

An unusual warm period from the 8th to the 21st resulted in rapid melting of the snow cover and caused the ice on the James River and right bank Missouri tributaries in the Dakotas to break up. The amount of overflow varied considerably along the right-bank streams. Heavy flooding developed on creeks and on the main stem of the James River from Jamestown, N. Dak., to Columbia, S. Dak., between the 15th and 25th. The James was reported 5 to 6 feet over its banks in the vicinities of Aberdeen and Stratford, S. Dak., and flooded about a mile in width over adjacent flats. At Jamestown, N. Dak., many families were evacuated for several days due to flooding. The principal damage from Jamestown, N. Dak., to Columbia, S., Dak., is believed to have been to roads, bridges, and farm levees. Minor overflow occurred on the Heart River in the lower portions of south Mandan, N. Dak., and on the Knife and Cannonball Rivers in North Dakota.

Flooding along the Big Sioux in South Dakota was confined to the area from Sioux Falls up to the source regions. Overflow from the Brookings area to near Sioux Falls ranged from around 1 1/2 to 2 1/2 feet over banks. Icejams were the main threat although they did not accentuate the flooding to any great extent. The Big Sioux remained below bankfull from a few miles below Sioux Falls to its mouth.

Some of the heaviest snow cover in South Dakota was on the middle and lower Moreau River drainage. The ice broke up on the Moreau, north of Faith, S. Dak., from the 13th to the 15th. Icejams and heavy runoff caused the stream to rise 5 to 8 feet over its banks below Thunder Butte, S. Dak., between the 15th and 25th.

The winter ice broke up on the Grand River in the Shadehill, S. Dak., area from the 13th to the 15th and continued to break up on downstream during the following week. About 6 feet of water was reported over county road crossings on the 16th and 17th. A settlement, Little Eagle, near the mouth of the Grand, was evacuated because of the threat of icejam flooding.

Overflow, resulting from icejams, occurred on the lower reaches of the Bad River from Midland to Ft. Pierre, S. Dak., from the 14th to the 19th. Stages at, and for a few miles above Ft. Pierre, were 3 to 4 1/2 feet over its natural banks. No damage was reported in this area as Ft. Pierre is protected by levees. Icejams developed on the White River on the 10th and 11th from above Interior to below Kadoka, S. Dak. Ice breakup continued through the 15th to its mouth. Overflow attending some jams was reported to be a quarter to a half-mile wide.

Strong warming developed along the Niobrara River from Valentine to Niobrara, Nebr., on the 10th and 11th. Runoff was sufficient to cause a quick ice breakup from near Norden to below Meadville, Nebr., on these dates. Large icejams formed in the vicinity of Spencer, Nebr., on the 12th. Some damage resulted to bridge approaches and to equipment inside the power house.

A second heavy snowstorm from the 21st to the 24th was more limited in scope than the earlier storm; although quite intense and destructive in northwest Iowa. This storm deposited 6 to 10 inches of snow from the Black Hills in South Dakota to near North Platte, Nebr., and 7 to 12 inches over a broad area extending from northeast Nebraska to southern Minnesota. Little or no snow occurred over central and eastern South Dakota. The 2-week warm period greatly reduced the frost in the ground, so most of the snowmelt was absorbed. Only minor rises resulted.

Ohio Basin.--South Chickamauga Creek near Chickamauga, Tenn., rose to 4.7 feet above flood stage on the 6th. It was out of its banks from the 4th to the 7th.

White Basin.--The Cache River at Patterson, Ark., went above flood stage on January 2 and was still in flood at the end of March.

The lower White River at Clarendon, Ark., was in flood from February 16 to March 10. At St. Charles, Ark., the river was out of its banks from February 27 to March 9. The flooding was minor and no damages were reported during March.

Lower Mississippi Basin.--The Big Black River in Mississippi went out of its banks at Bovina, Miss., on February 21. It receded within its banks on March 1.

PACIFIC SLOPE DRAINAGE

Coquille Basin.--The only serious flood conditions that developed during March occurred along the western slopes of the coast range. Small streams responded to the periodically heavy rain during the first 10 days and flowed bankfull or over during this period. The heavier rain on the 8th and 9th caused the South Fork Coquille to rise 3.1 feet above flood stage on the 9th. It receded within its banks on the 10th. Minor flooding occurred on the Coquille at Coquille, Oreg., on the 10th. One bridge approach was washed out in the Powers, Oreg., area. Minor stream bank erosion resulted in some low level pasture flooding.

Columbia Basin.--Heavy rain beginning late on the night of the 7th and continuing for 36 hours caused flooding along some tributary streams in the Willamette Basin between the 9th and 14th. Freezing levels during this period were 5,000 feet. The Coast Range tributaries rose to bankfull stage early on the 9th and crested on the same date. The South Yamhill at Whiteson, Oreg., exceeded flood stage by 4.2 feet. The Pudding and Tualatin reached crests above flood stage on the 10th and 12th. The main stem of the Willamette rose 8 to 10 feet with crests generally 6 to 7 feet below flood stage. At Portland, Oreg., the Willamette rose from 5 feet to near 10 feet on the 10th and 11th, or 8 feet below flood level.

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available.

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from lithium chloride hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes, dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. They were also equipped with carbon hygristors. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.C.T.

R More than half of the observations are from statistical values.

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun.

H	Haze
S	Slight haze - indeterminable
M	Moderate haze - indeterminable
*	Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

MARCH 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	123	10	22	-85	29	5	32	17	91	50	83	171	196	230	182	192	-88	73	116	163	152	71	207	221	211	236	213	241	204	211	158	123

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

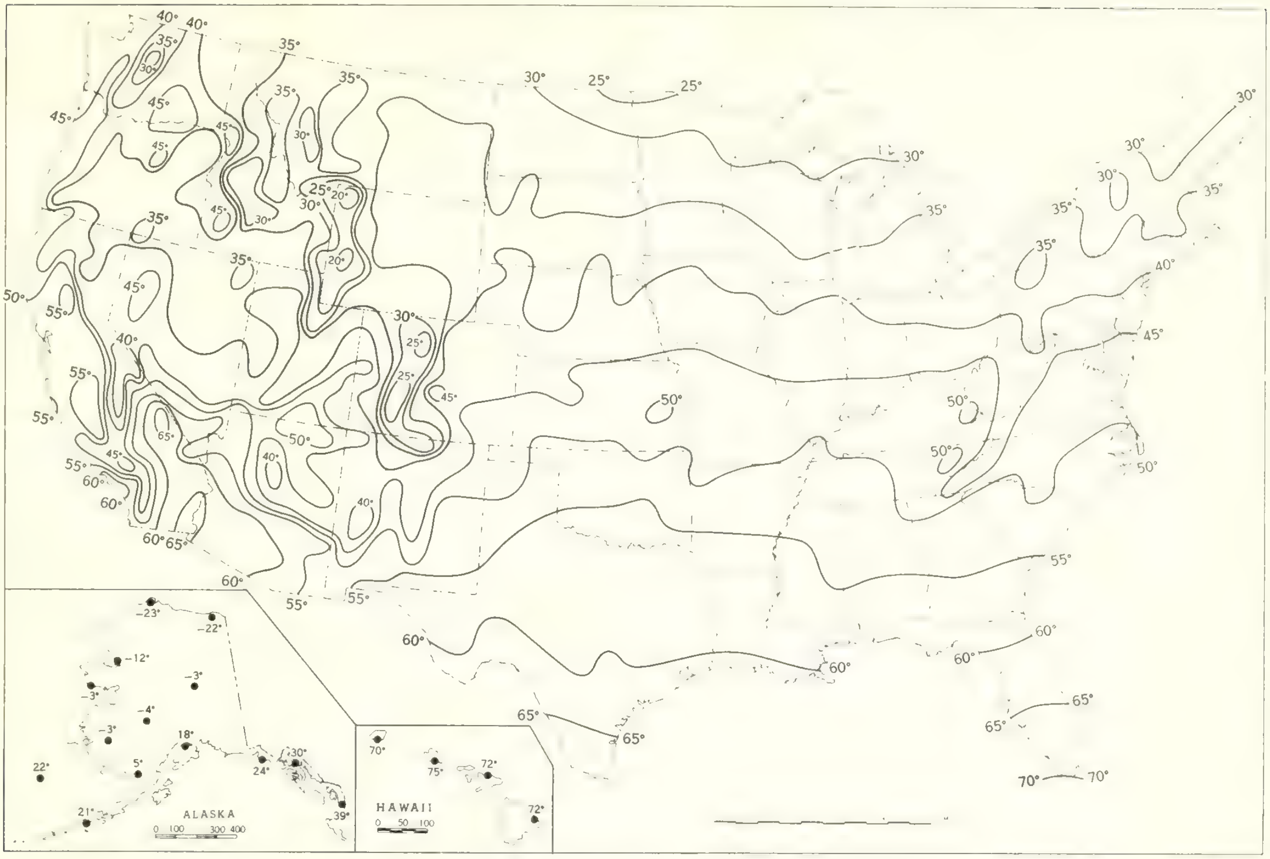
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λs Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

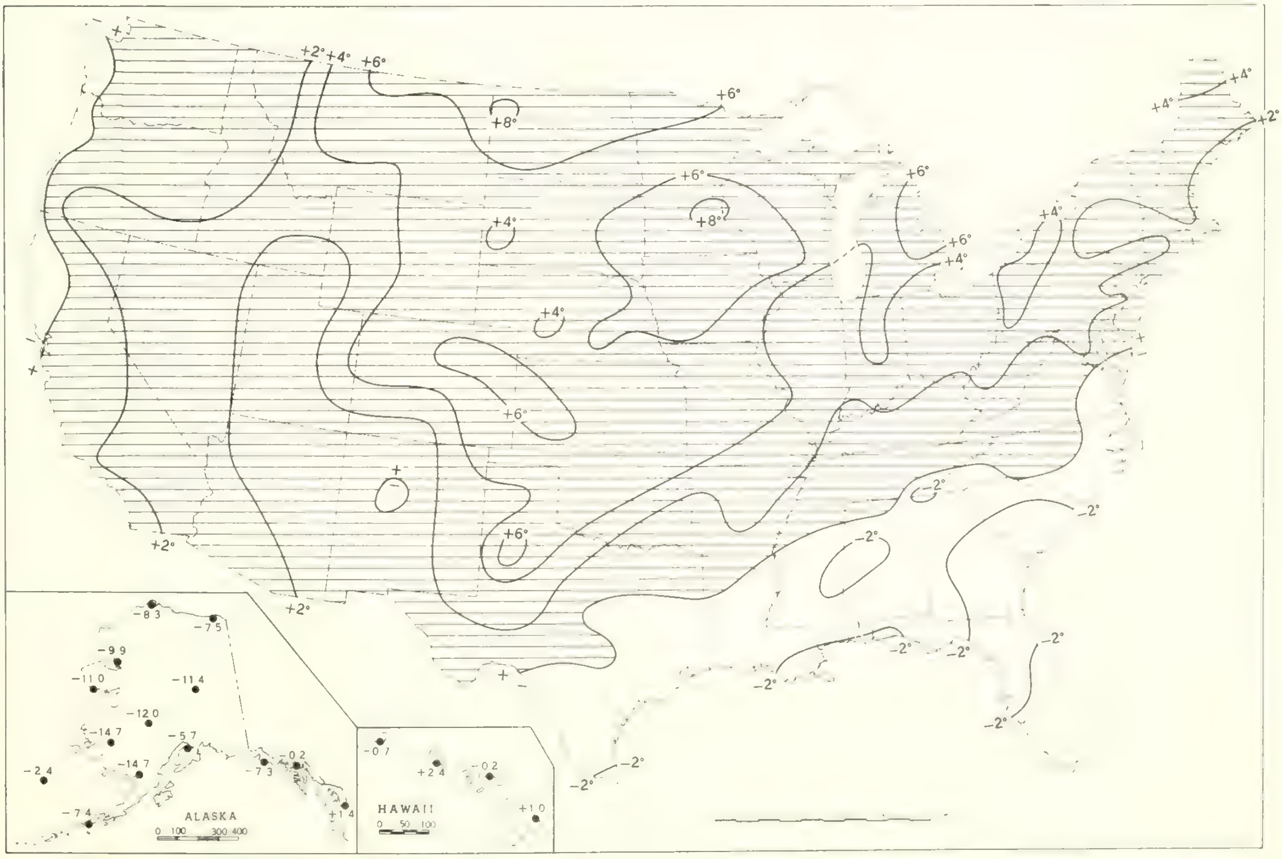
Station	Day of month																														
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

Chart I. A. Average Temperature (°F.) at Surface, March 1966.



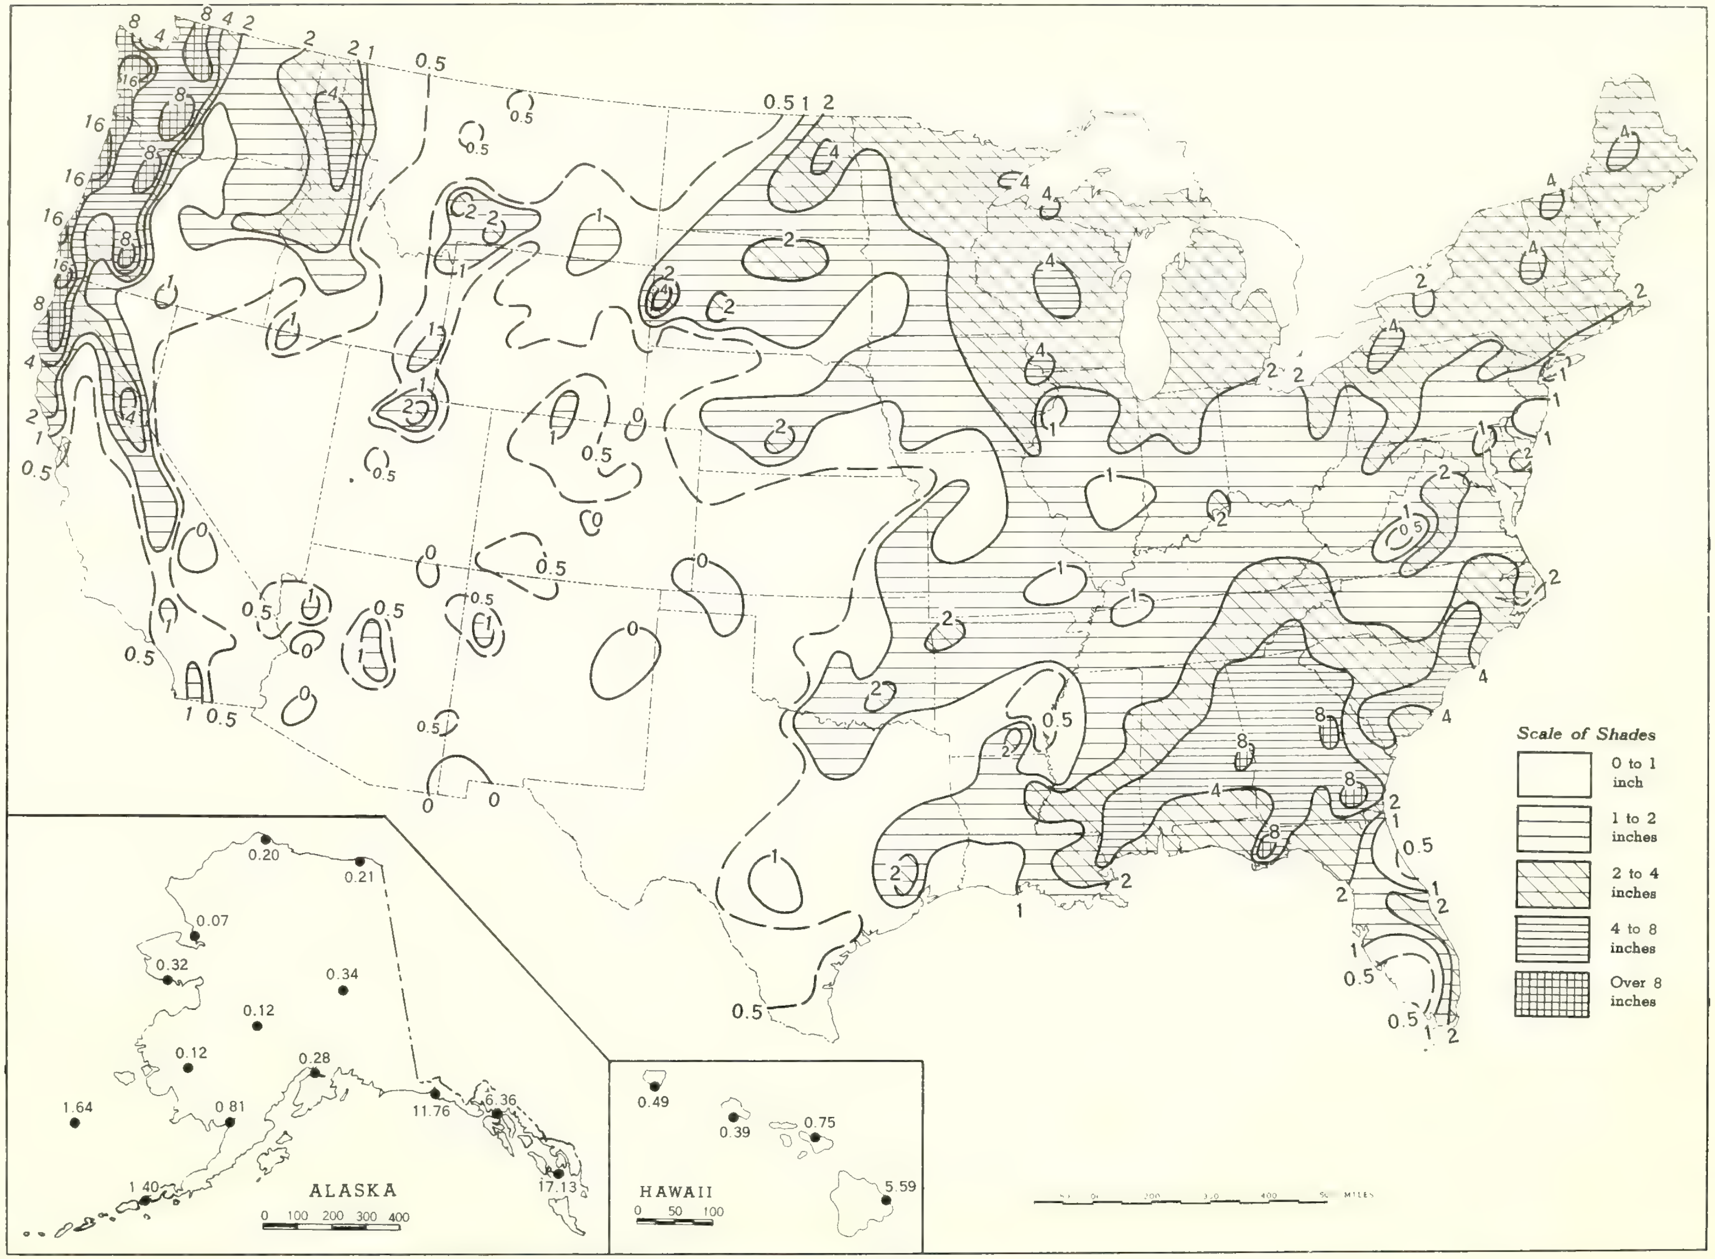
B. Departure of Average Temperature from Normal (°F.), March 1966.



A. Based on reports from over 870 Weather Bureau and cooperative stations. The monthly average is half the sum of the monthly average maximum and monthly average minimum, which are the average of the daily maxima and daily minima, respectively.

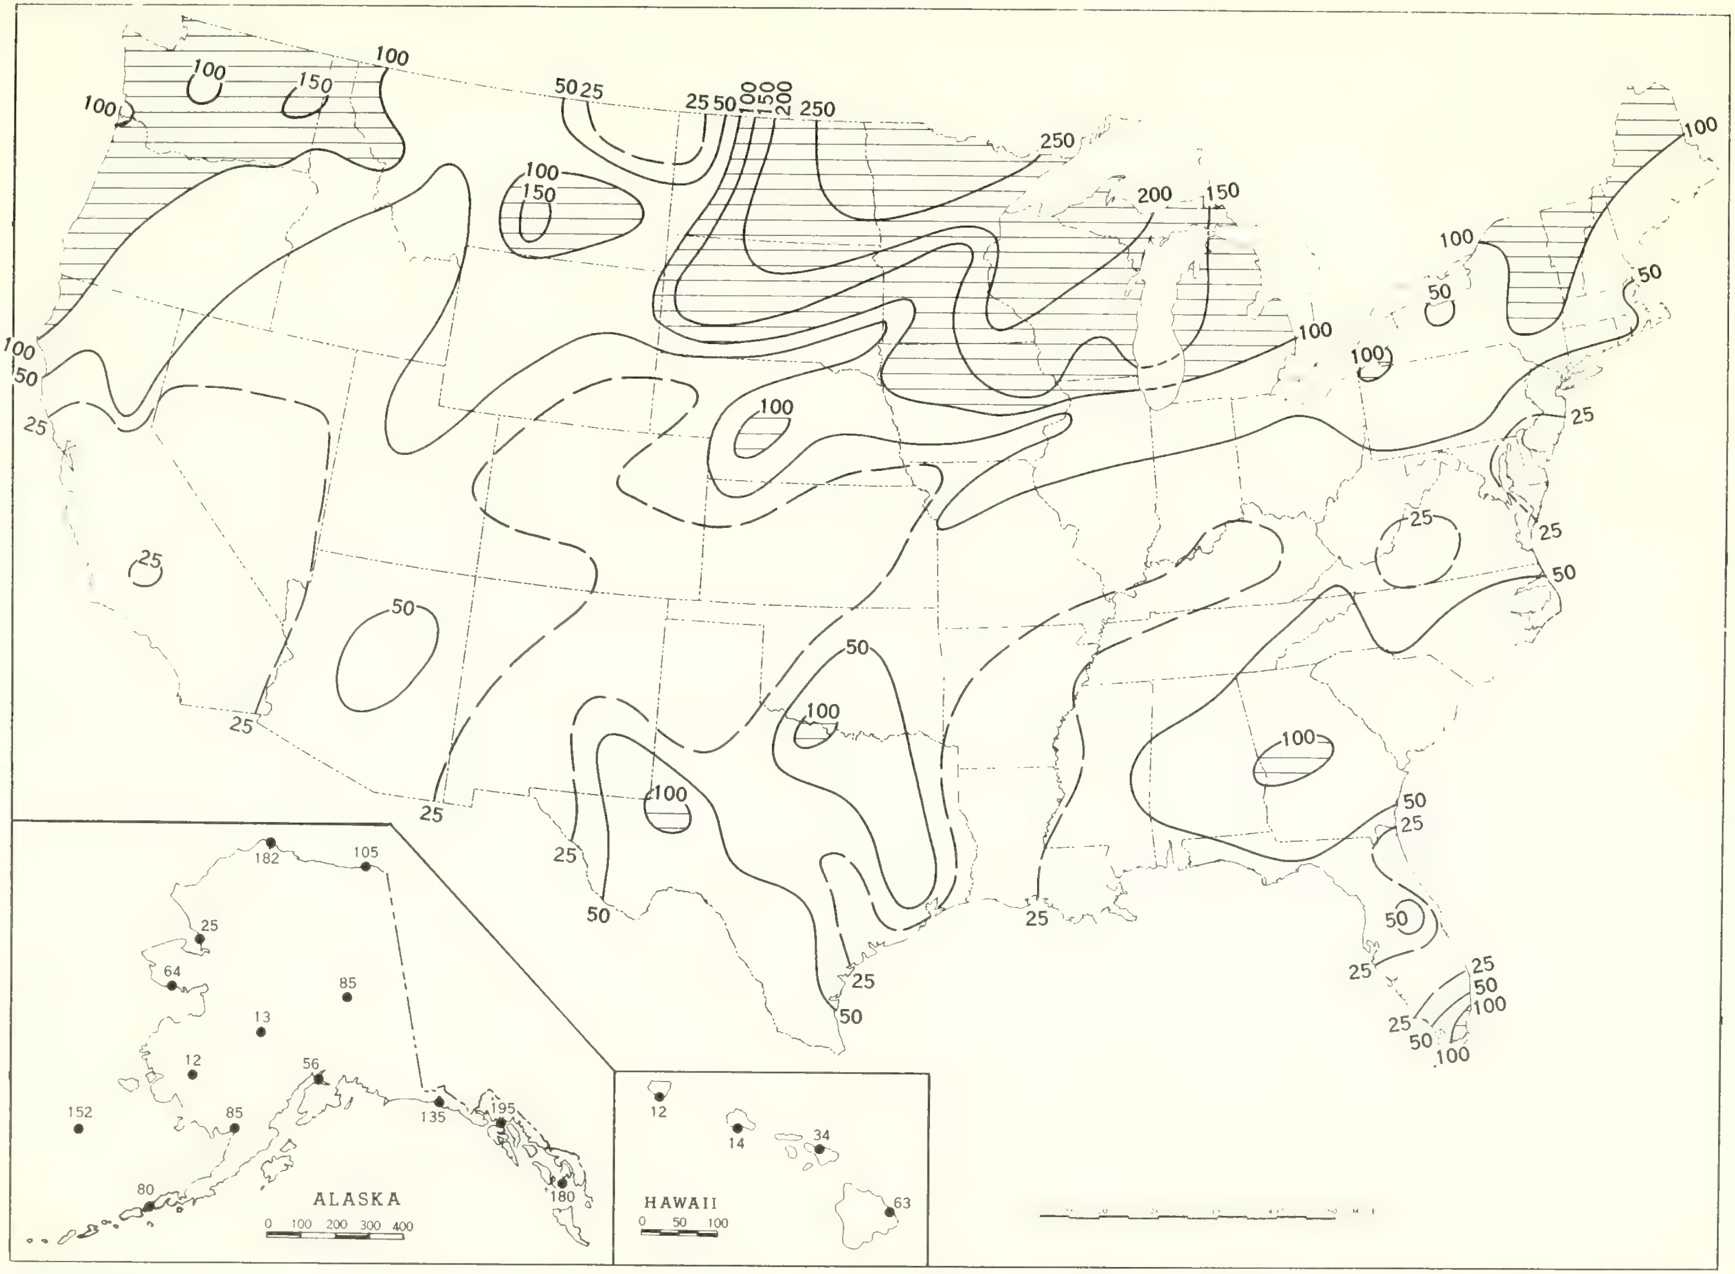
B. Departures from normal are based on the 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart II. Total Precipitation (Inches), March 1966.



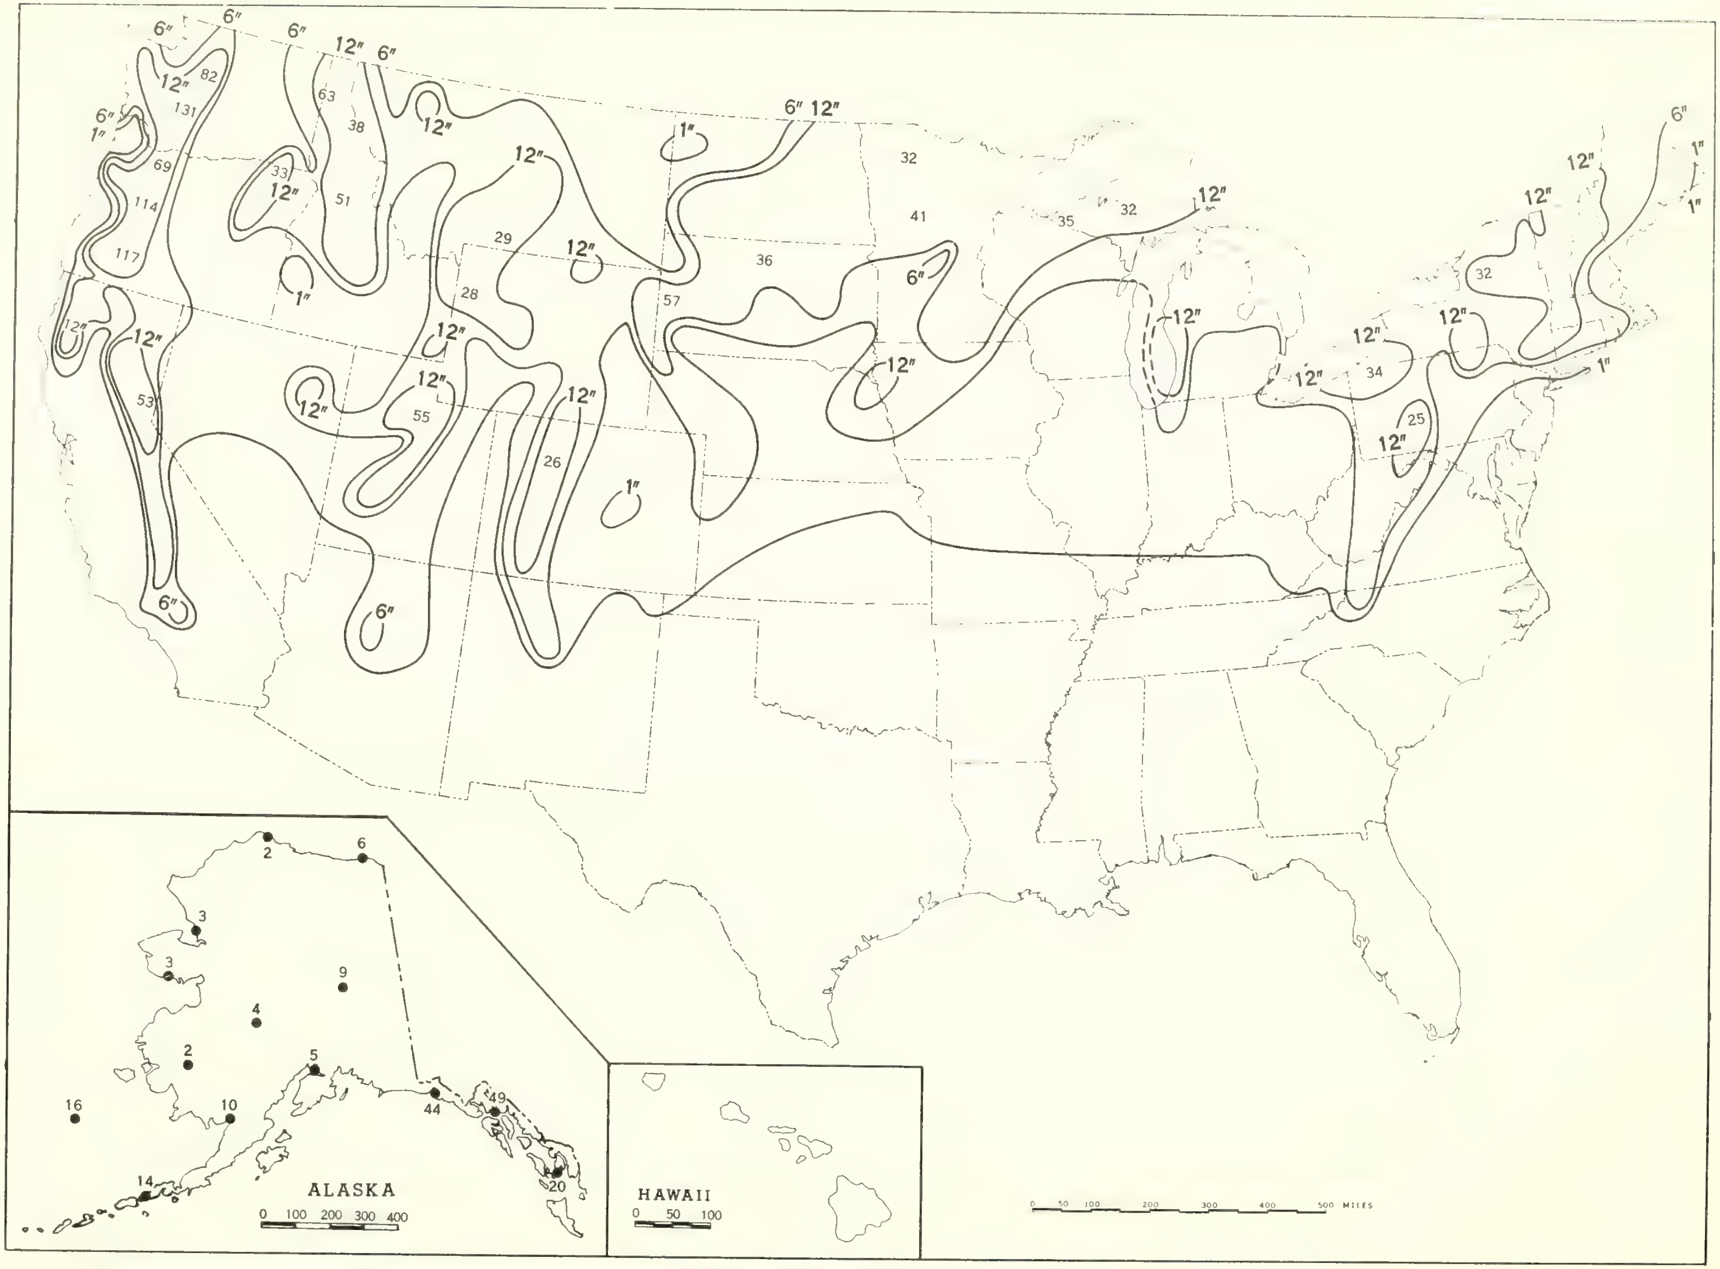
Based on daily precipitation records at about 870 Weather Bureau and cooperative stations.

Chart III. Percentage of Normal Precipitation, March 1966.



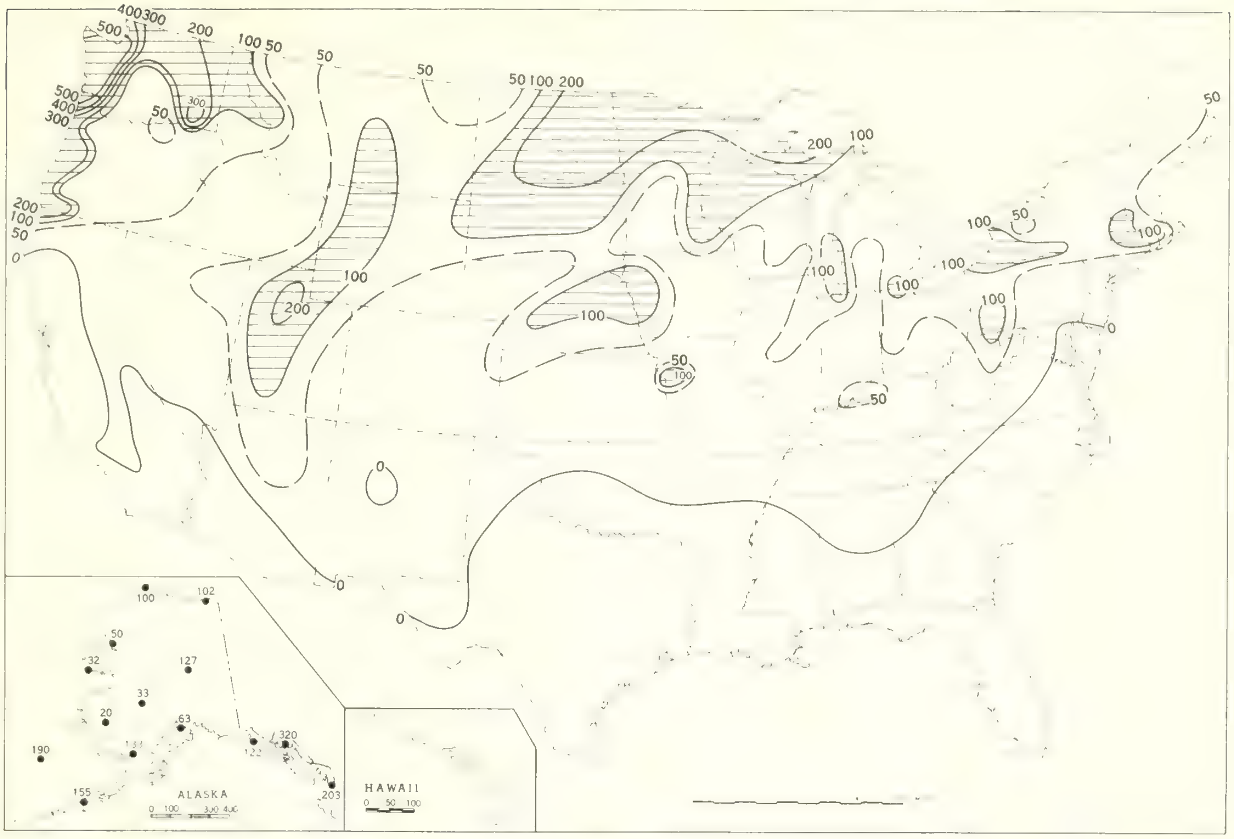
Normal monthly precipitation amounts are computed from the records for 1931-60 for first-order Weather Bureau stations.

Chart IV. Total Snowfall (Inches), March 1966.

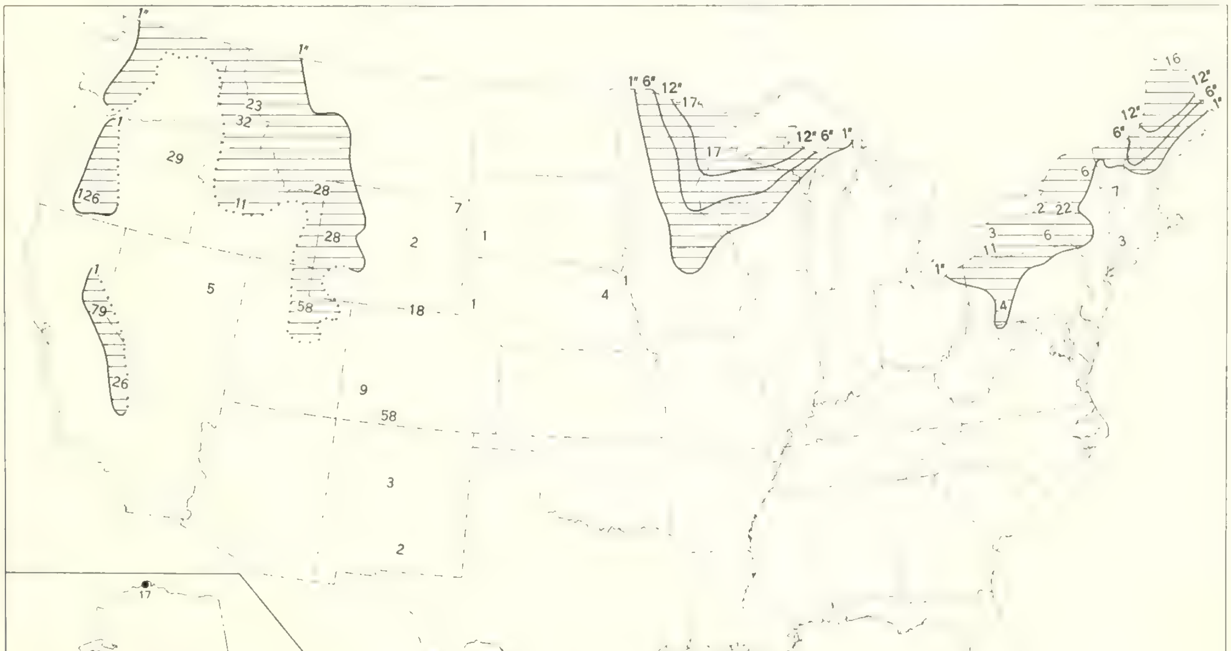


This is the total of unmelted snowfall recorded during the month at Weather Bureau and cooperative stations. This chart and Chart V are published only for the months of November through April although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, March 1966.

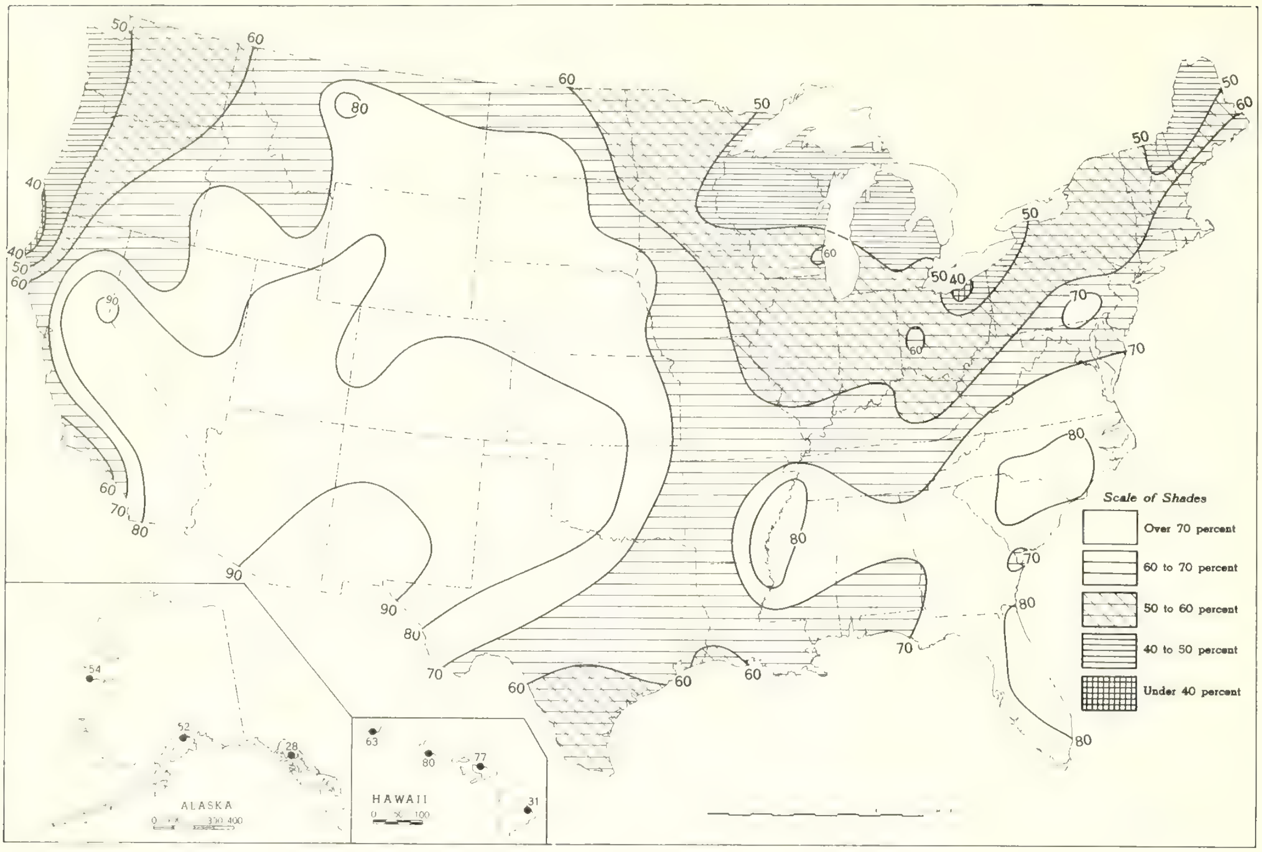


B. Depth of Snow on Ground (Inches), 7:00 a. m. E. S. T., March 28, 1966.

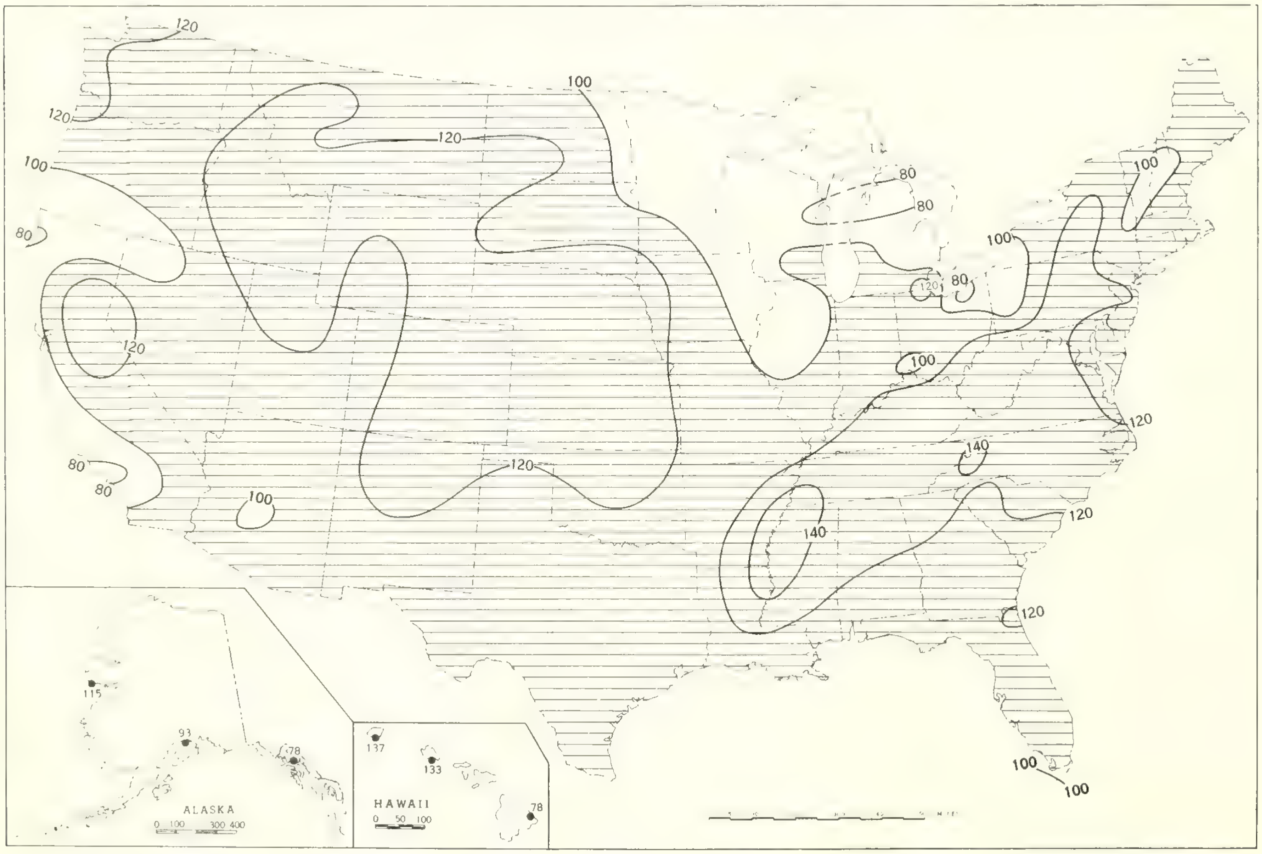


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a. m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, March 1966.

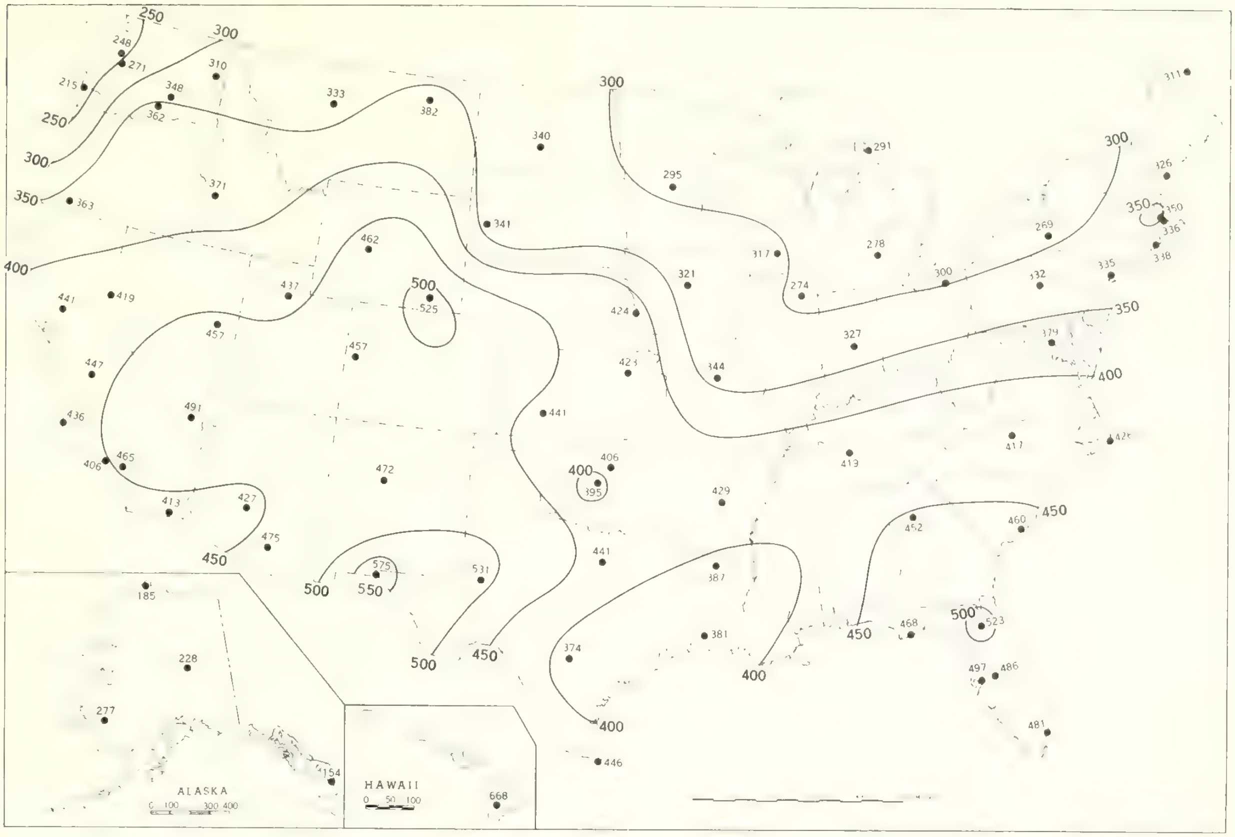


B. Percentage of Mean Monthly Sunshine, March 1966.

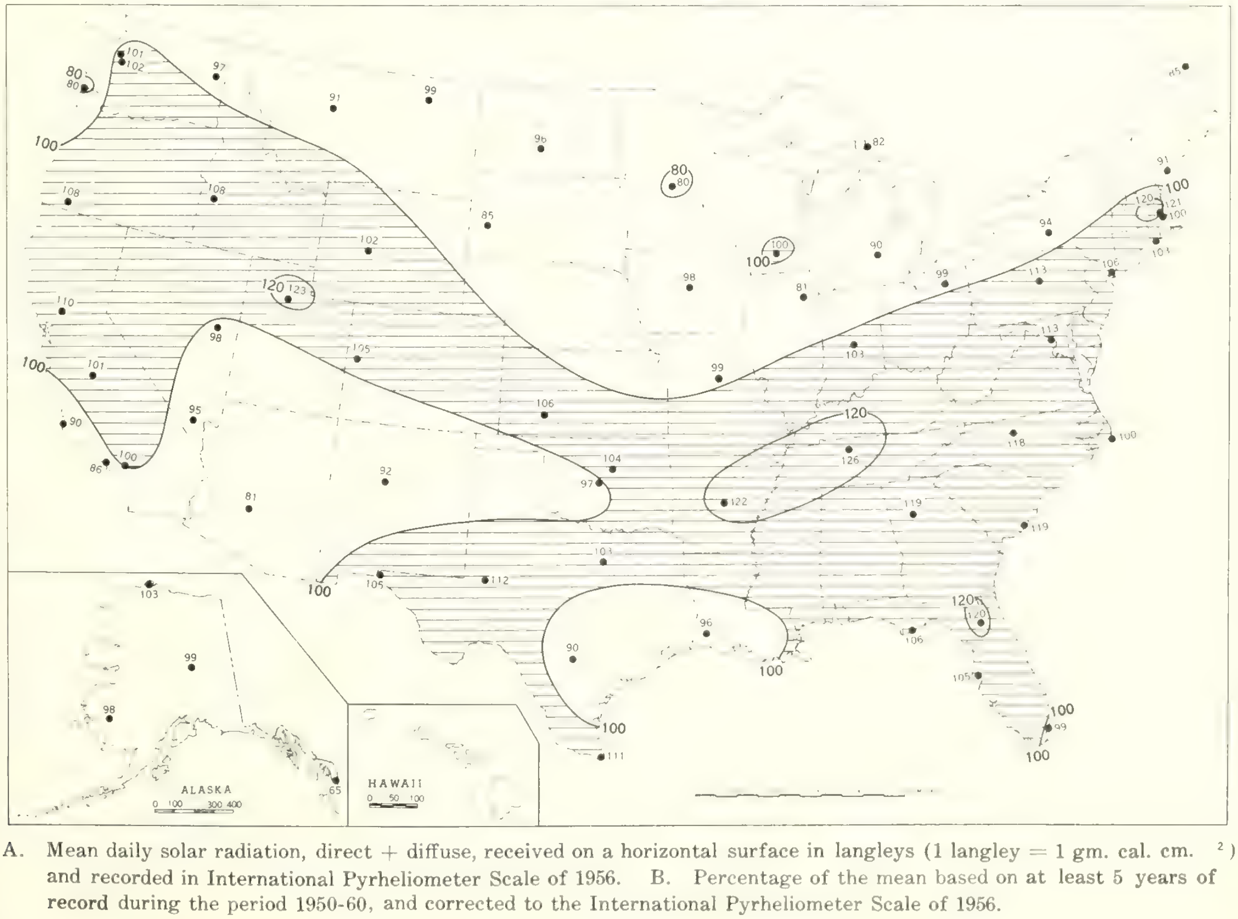


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, March 1966.

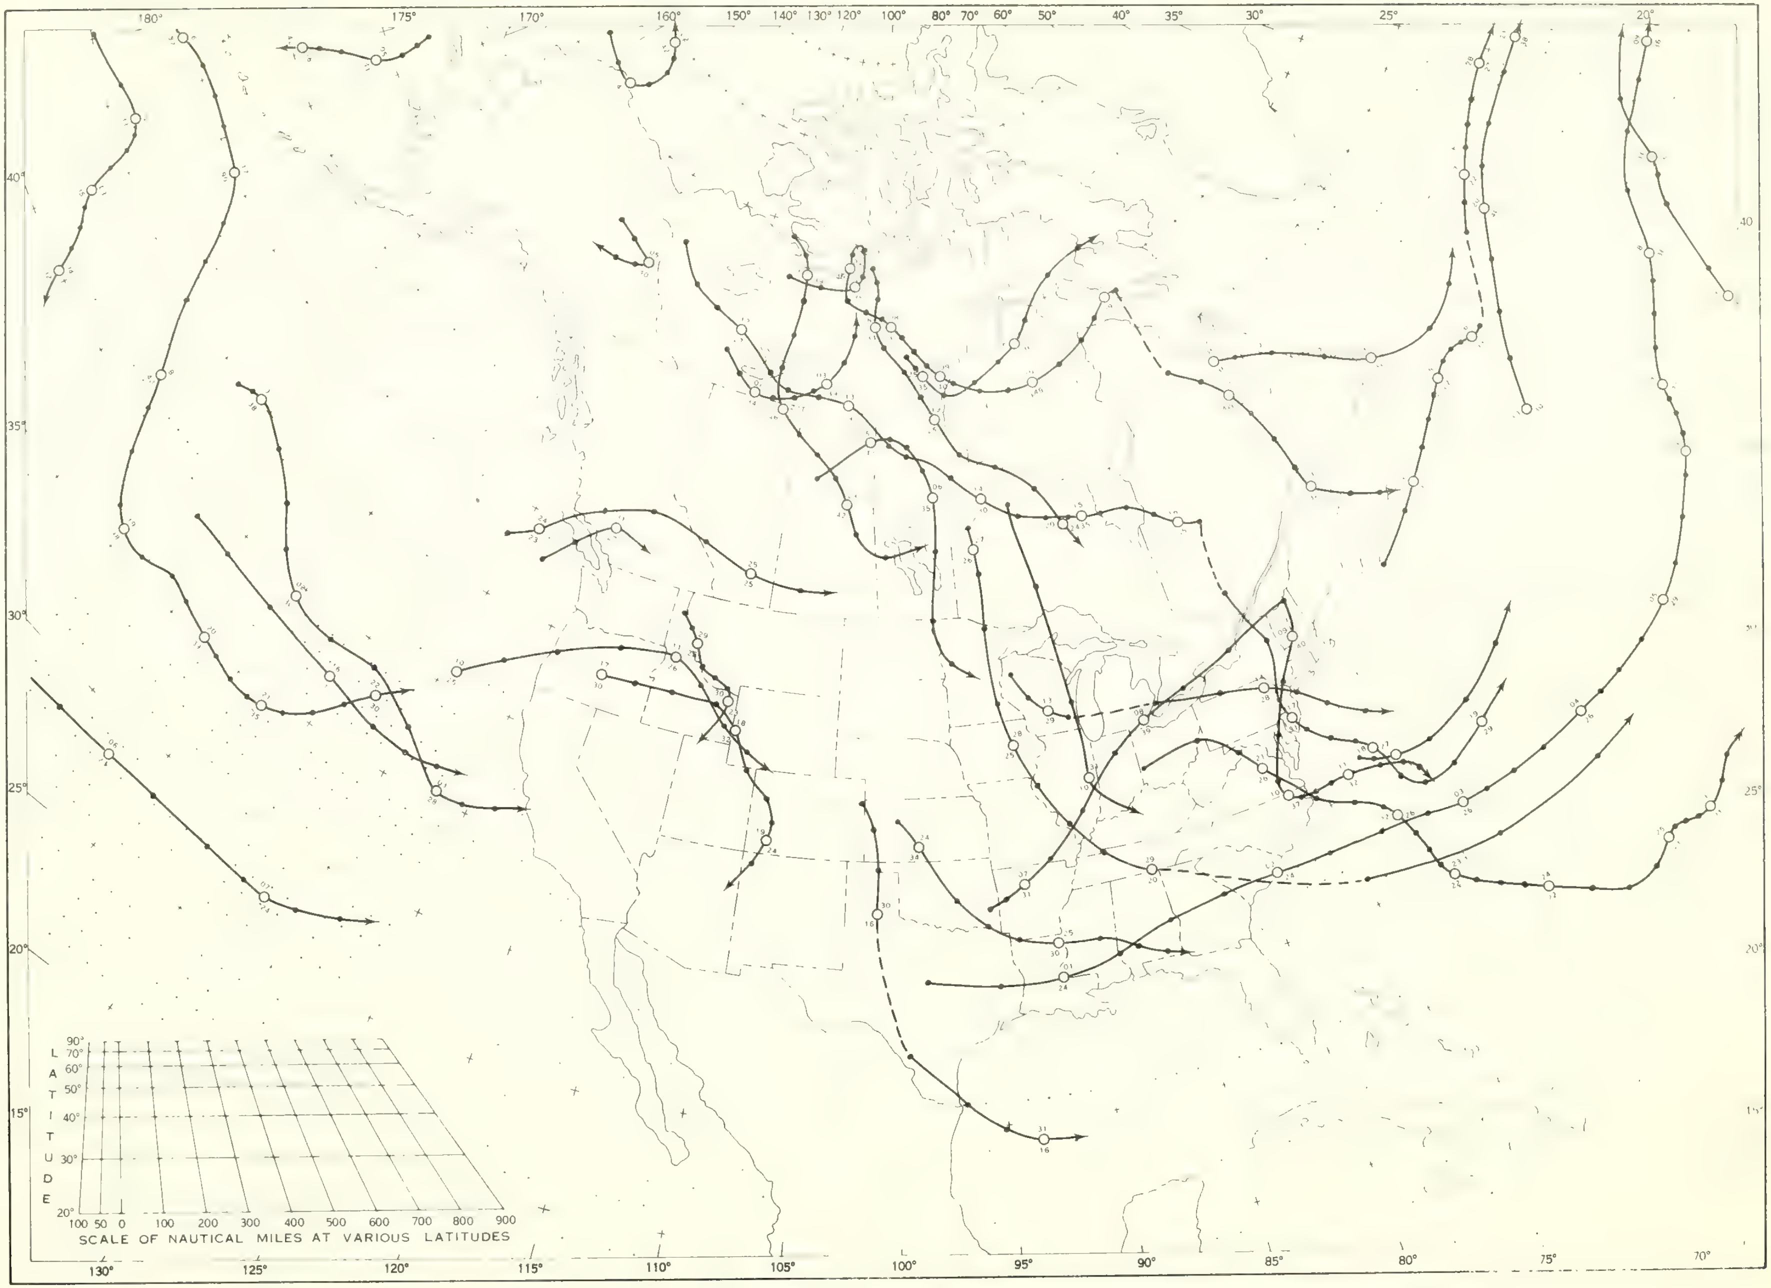


B. Percentage of Mean Daily Solar Radiation, March 1966.



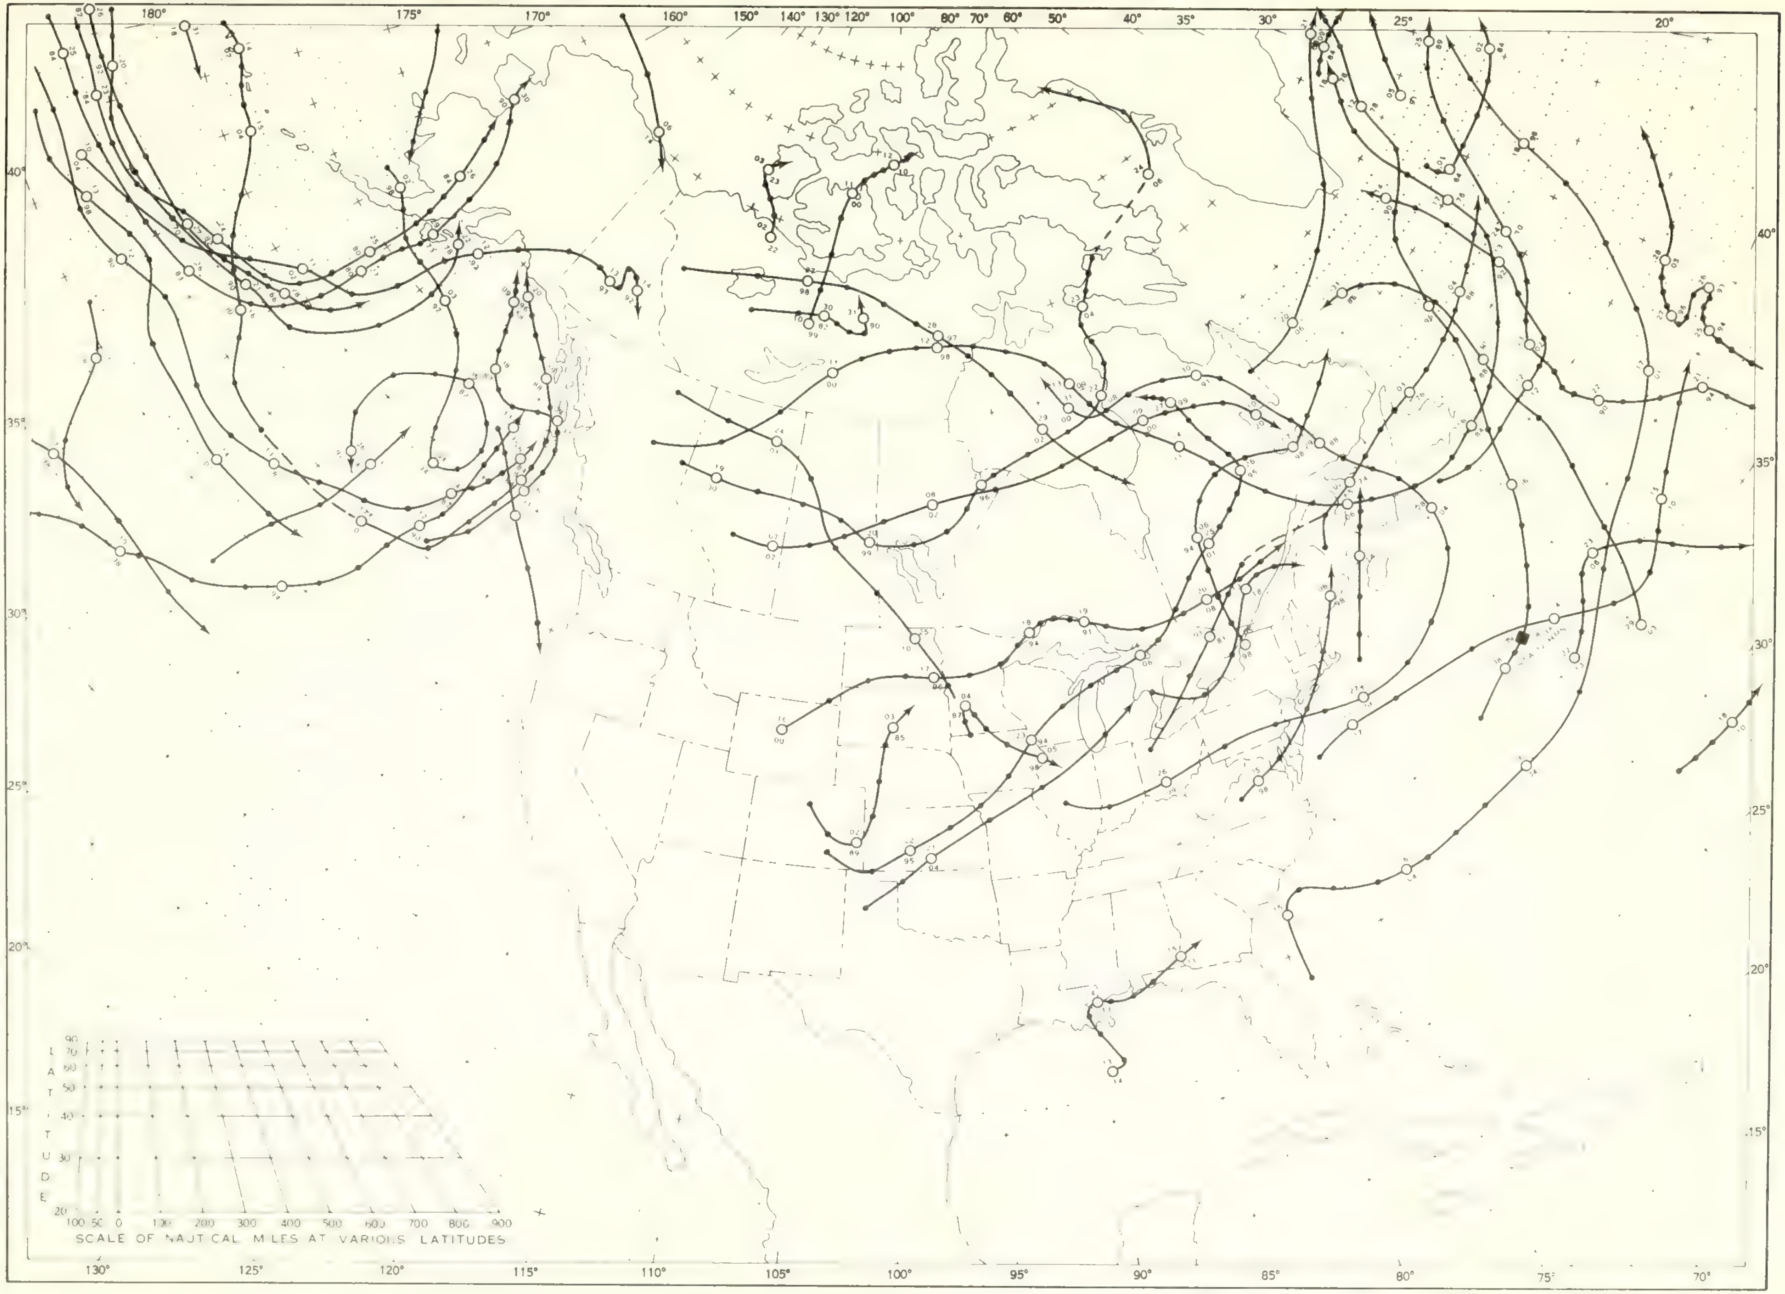
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, March 1966.



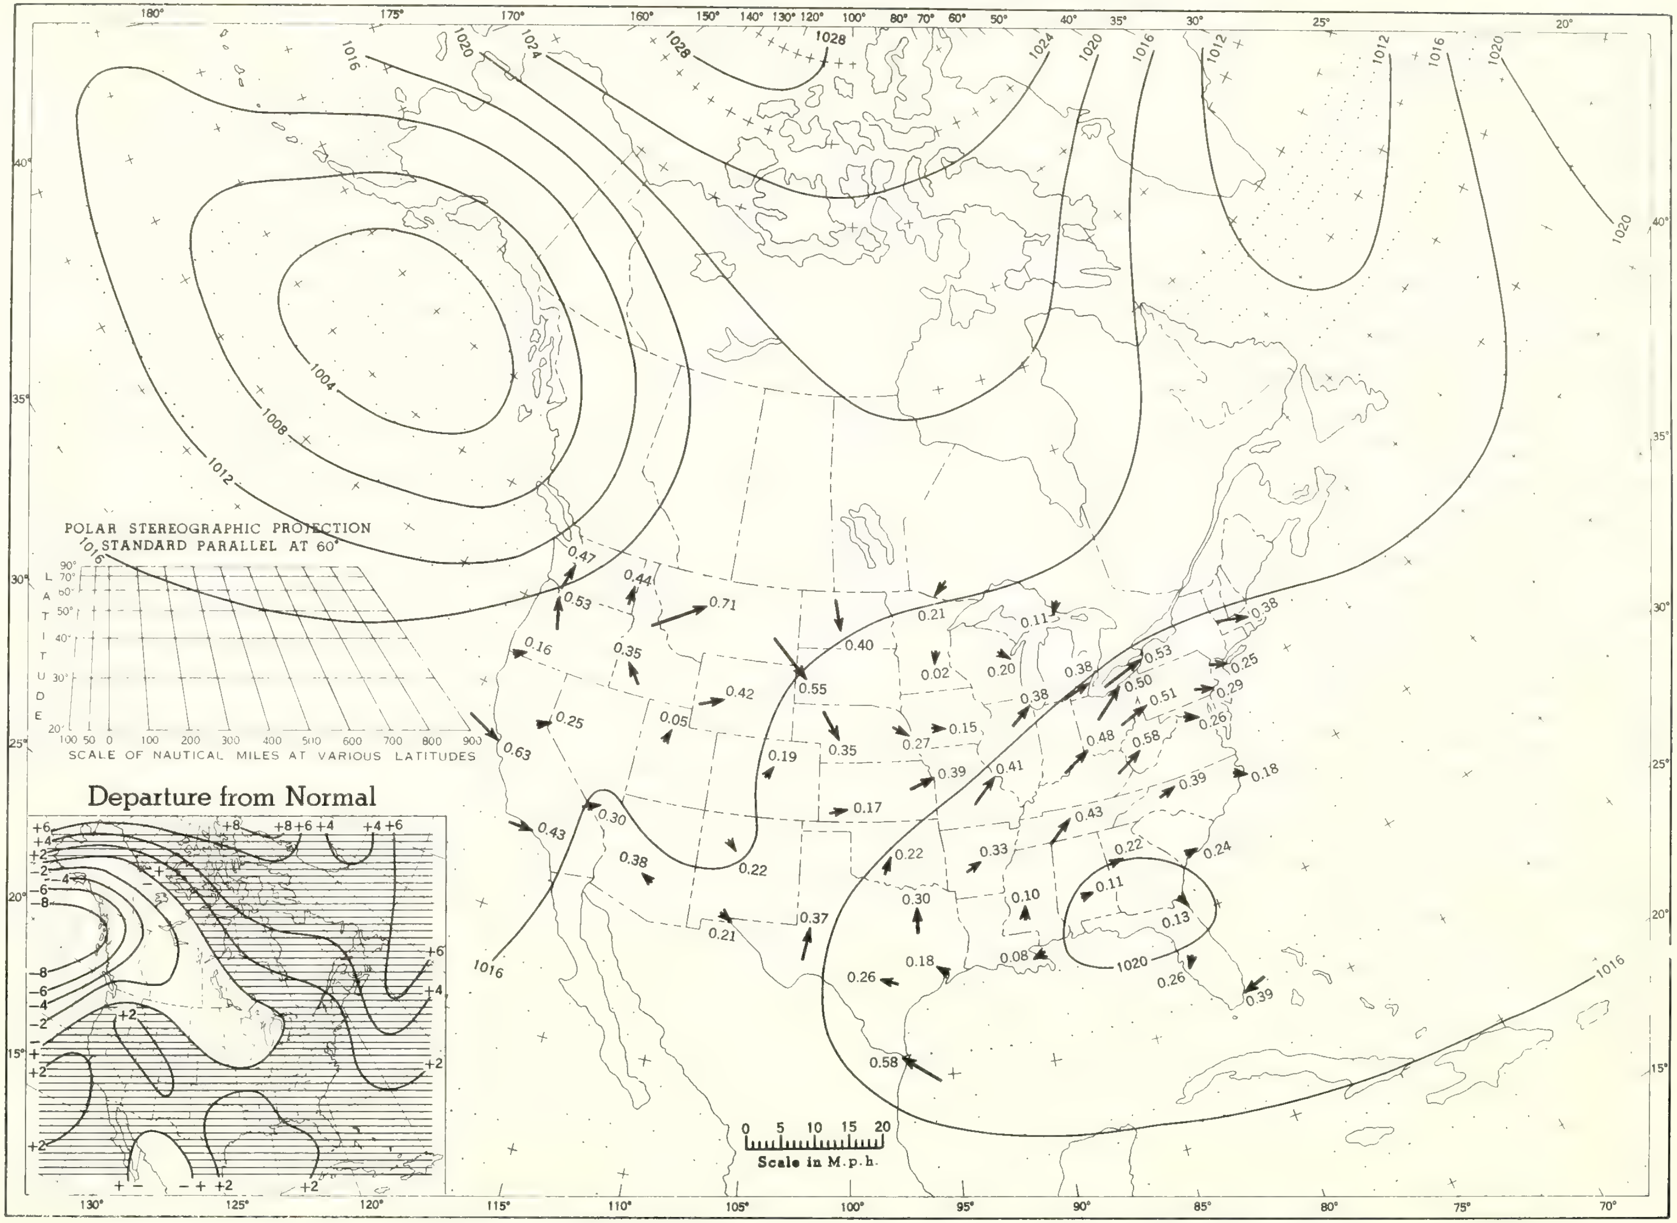
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, March 1966.



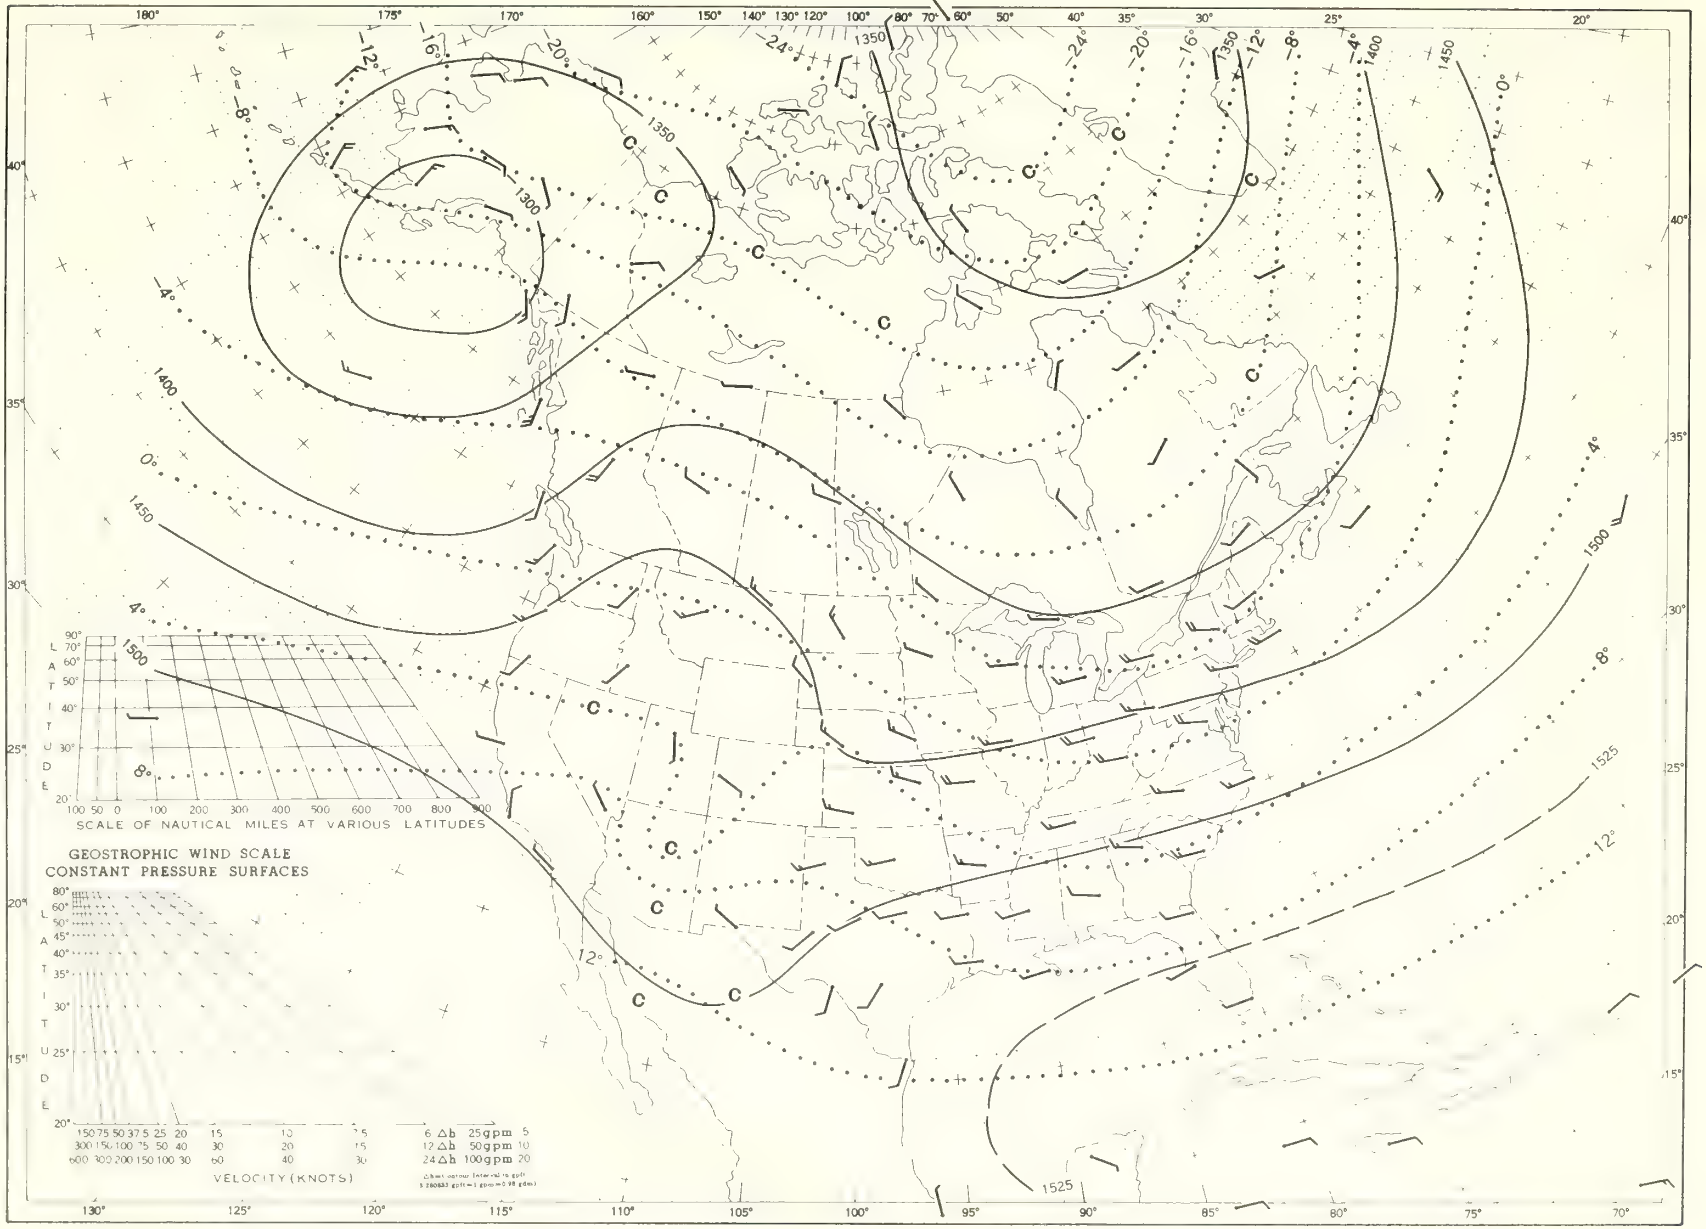
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and **Resultant** Surface Wind, March 1966. Inset: Departure of Average Pressure (mb) from Normal, March 1966.



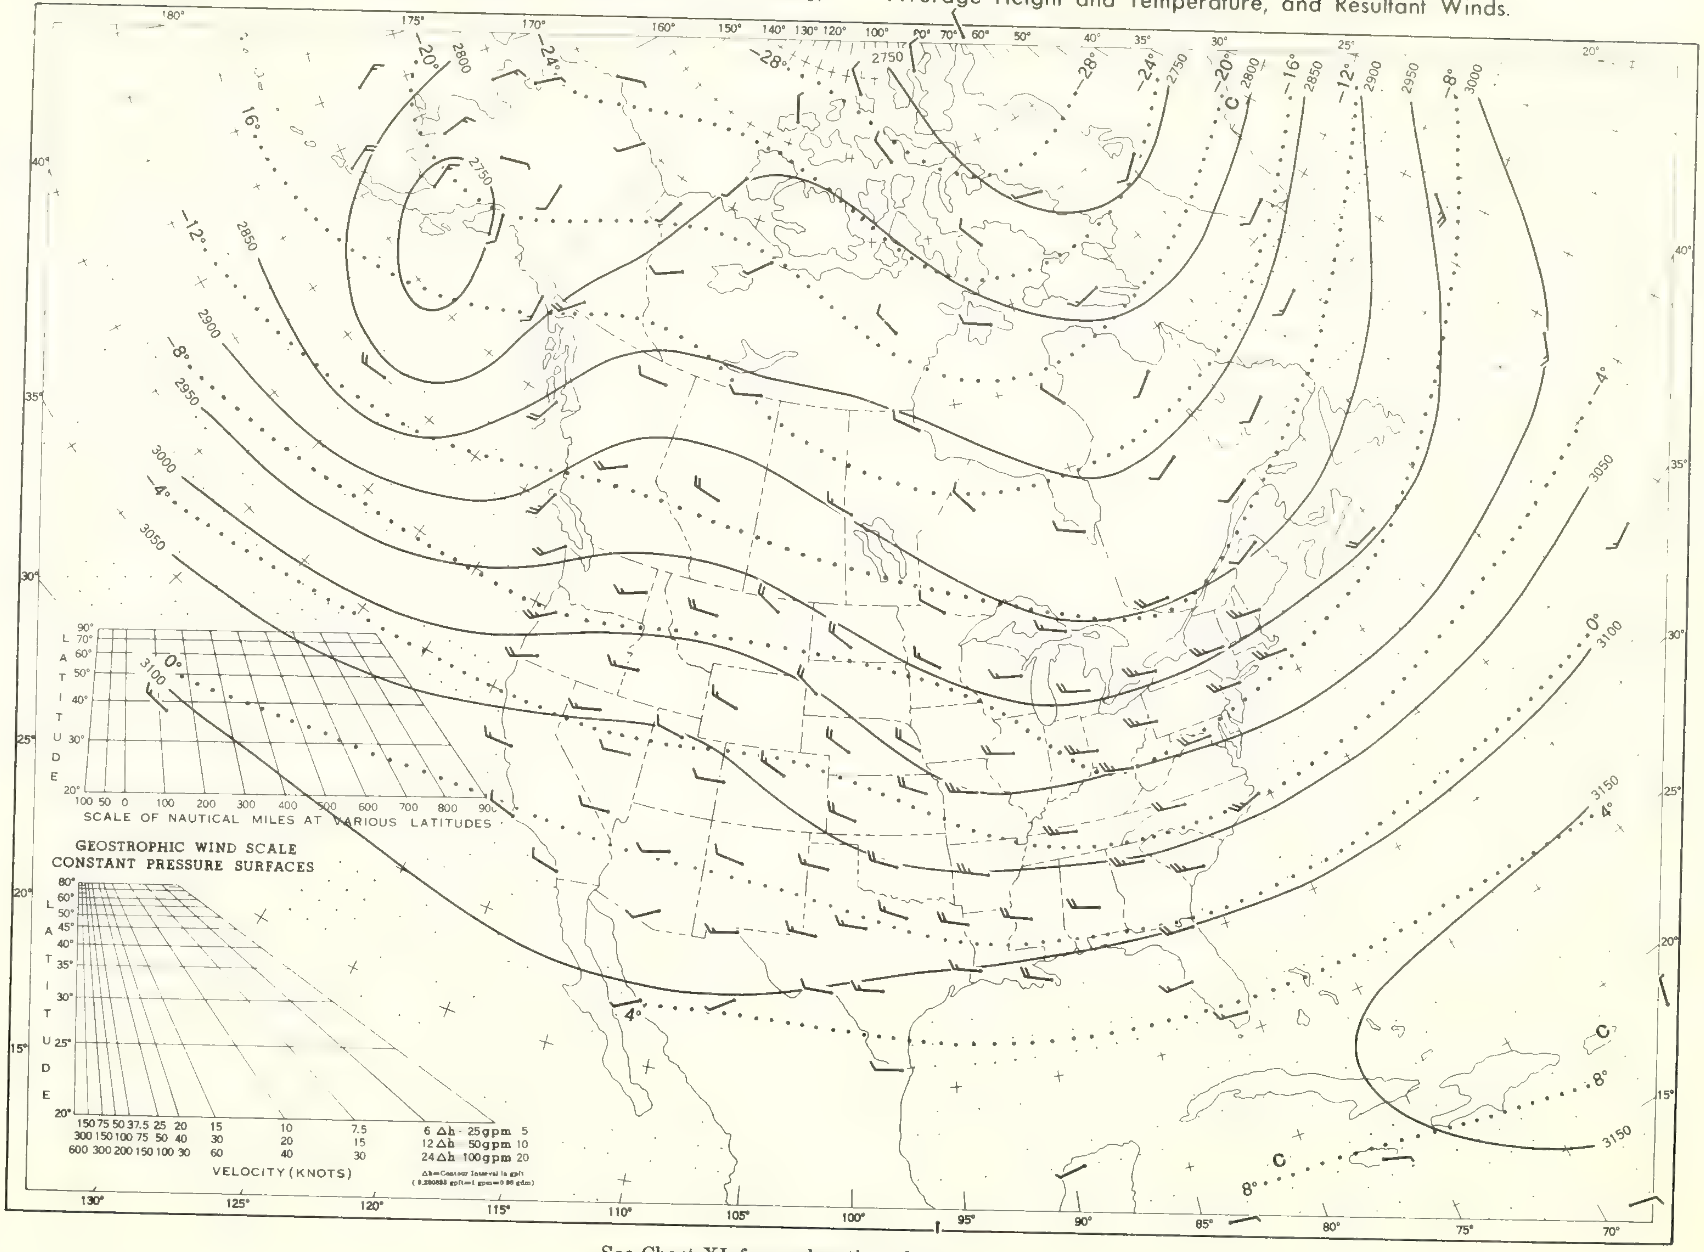
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, March 1966. Average Height and Temperature, and Resultant Winds.



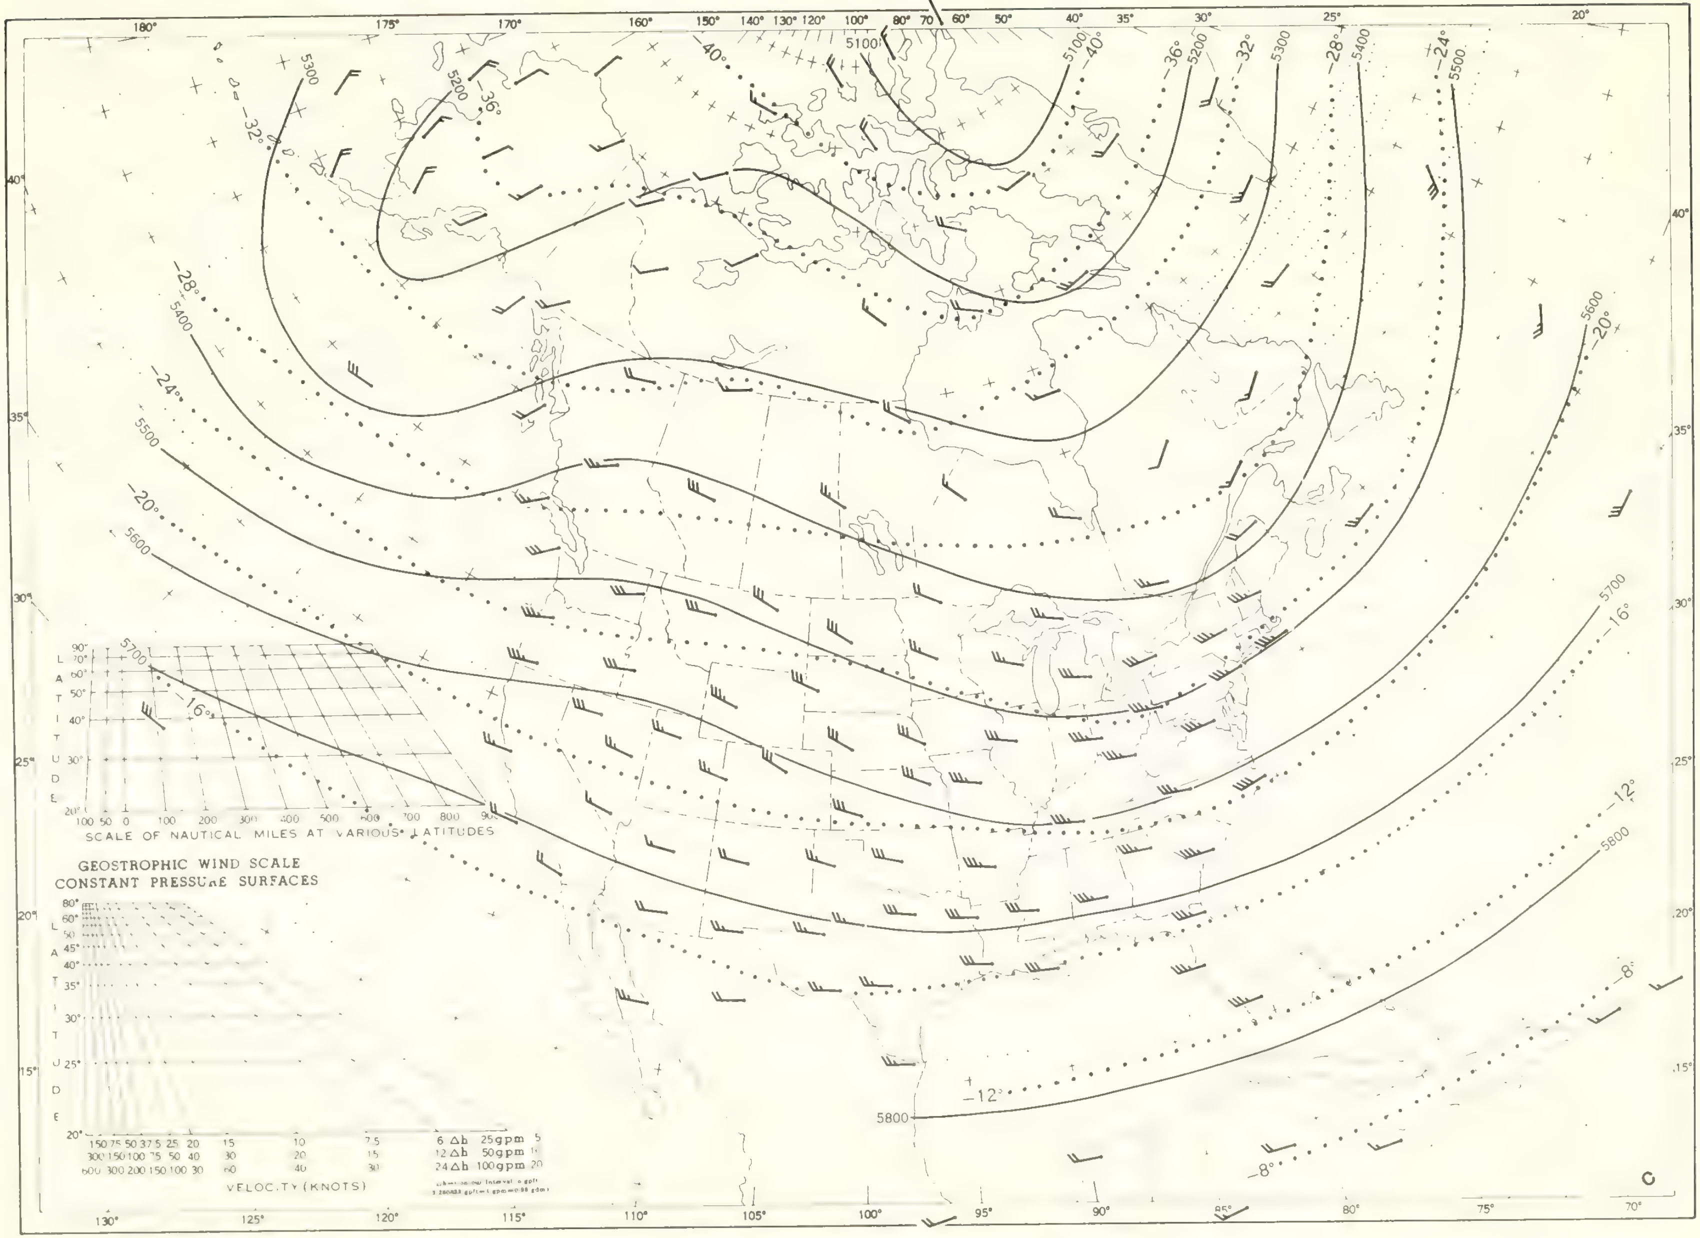
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, March 1966. Average Height and Temperature, and Resultant Winds.



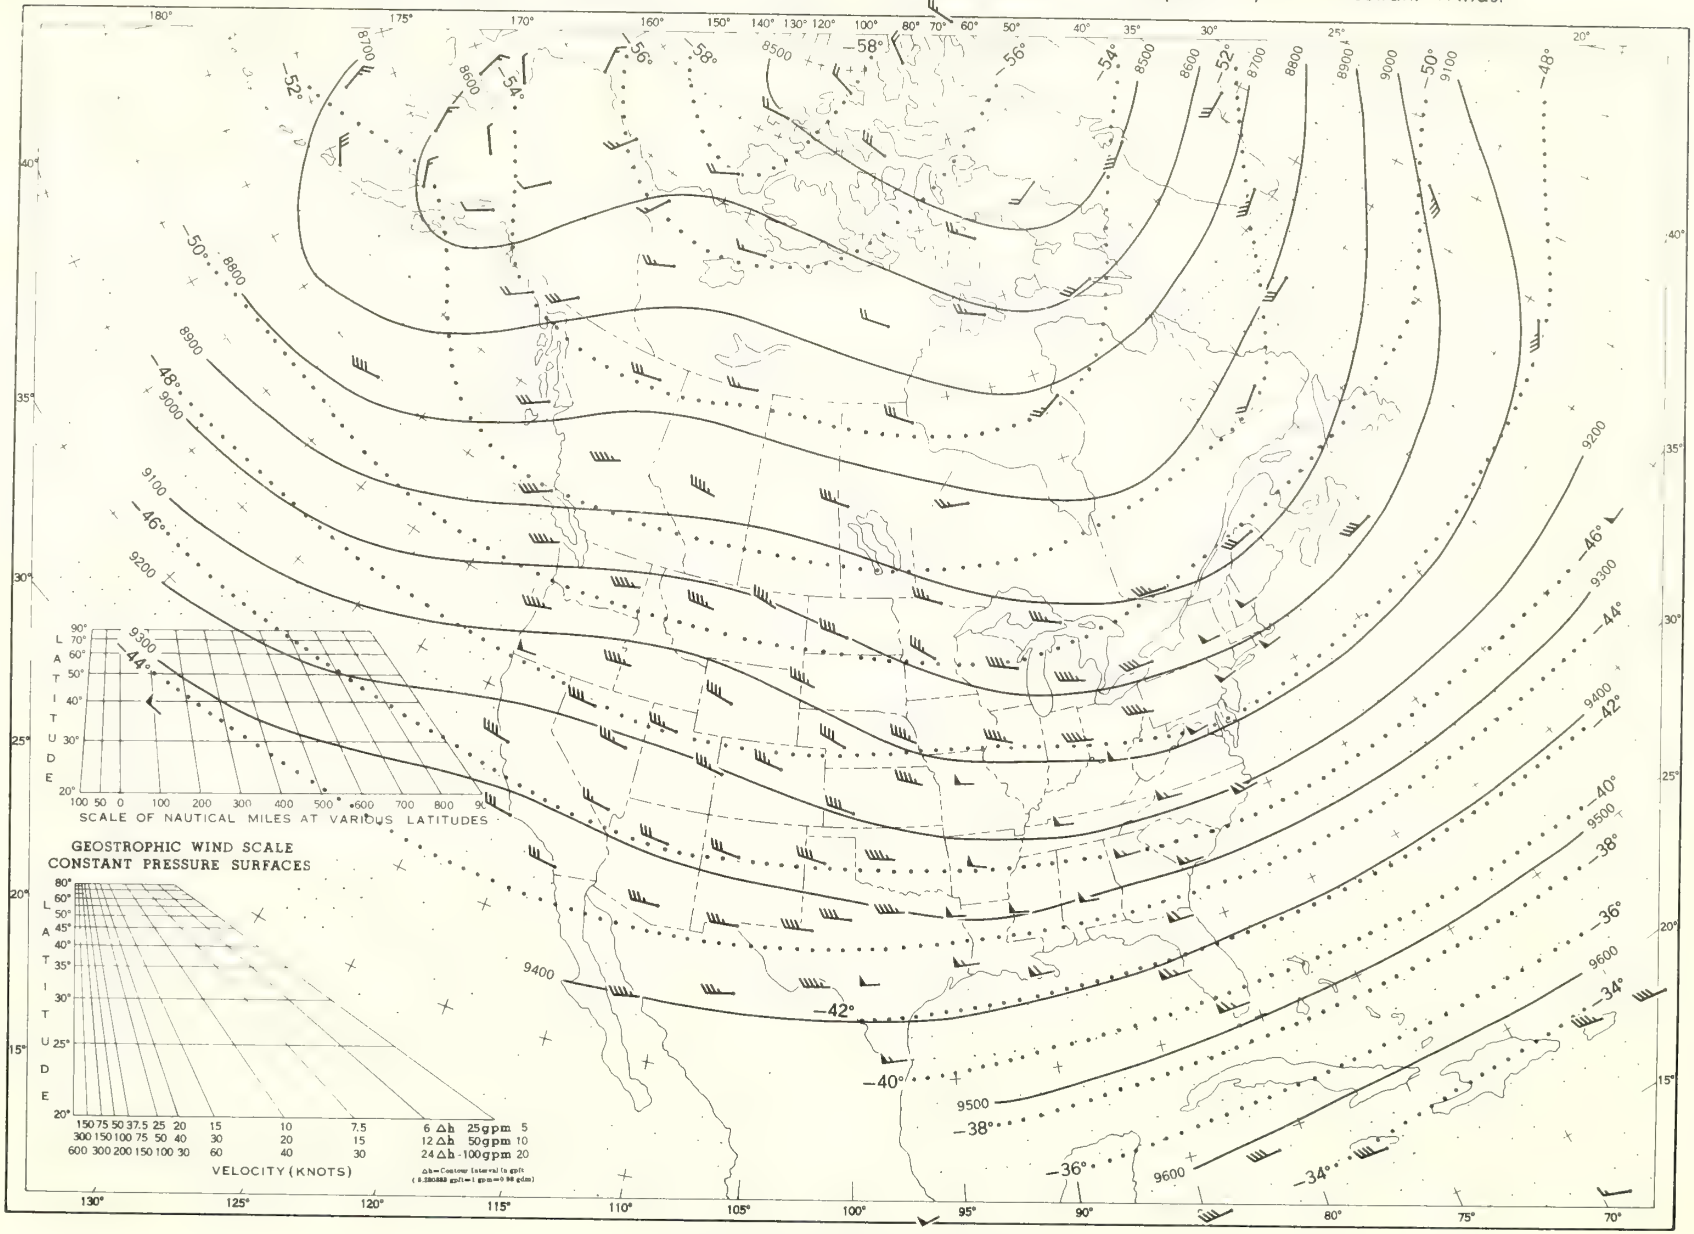
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, March 1966. Average Height and Temperature, and Resultant Winds.



See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, March 1966. Average Height and Temperature, and Resultant Winds.



See Chart XI for explanation of map.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 4 APRIL 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Heavy rainfall southeast Plains and lower Mississippi Valley.

2. Dry weather and drought continued in much of Northeast.

3. Severe flash floods in northeast Texas.

4. Second consecutive dry month in Far West.

5. Record snowstorm in Central Rockies.

TEMPERATURE.--Temperatures for April 1966 averaged above normal in the Pacific States and some other parts of the Far West, in the Gulf coastal areas from Texas through Alabama, and in northern Maine. Relative to normal, the warmest area was California's Central Valley which was about 4° warmer than normal, and where Sacramento had its warmest April during a record dating back to 1878. The rest of the 48 states were cooler than normal, by as much as 4° to 6° in the northern Great Plains. Trenton, N. J., had its coolest April since 1943, and Bridgeport, Conn., its coolest on record.

Hidden in the monthly averages were the wide temperature fluctuations which began in March and continued through April. East of the Mississippi the first half of the month was much colder than normal, the third week unusually warm, and the rest of the month cold in the North and warm in the South. In the West the first half of the month was warm and the second half cold except that the last few days of the month were unusually warm in California. On April 1 high temperatures set new records for so early in the season at scattered stations over the western half of the Nation. Among these were Valentine, Nebr., 79°; Helena, Mont., 75°; Burns, Oreg., 78°; Fresno, Calif., 90°; and Phoenix, Ariz., 96°. On the 4th and 5th, however, a freeze caused extensive damage to fruit, particularly apricots and sweet cherries in west-central Colorado.

Following a prolonged abnormally warm period, unusually cold weather covered the western half of the nation about the 18th to 21st. Apricots and cherries which escaped freeze damage in the Grand Junction, Colo., area on the 4th and 5th were nearly wiped out on the 19th and 20th. Fruit was also damaged by this freeze in areas around Denver, Colo.; Pendleton, Oreg.; Walla Walla, Wash.; Amarillo, Tex., and many others. Record low temperatures for so late in the season were reported on the 20th as follows: 2° at Rapid City, S. Dak.; 8° at Flagstaff, Ariz.; and 1° at Lander, Wyo. Casper, Wyo., recorded -3.9° on the 19th, the lowest on record there for April.

PRECIPITATION.--Precipitation was well above normal in a broad belt extending from Texas and Louisiana northeastward through Illinois, southern Michigan, Ohio, and most of Pennsylvania, slightly above in the Dakotas, and generally below elsewhere.

In northeastern Texas where frequent thunderstorms occurred, rainfall was unusually heavy. Monthly totals ranged up to 26.68 inches at Gladewater. Dallas measured 15.40 inches, the greatest April rainfall there on record. The heaviest rainfall in this area fell during the last decade. Dallas recorded 12.39 inches during the last 9 days of the month. During this period severe flash floods caused heavy property losses and a number of persons lost their lives.

Unusually heavy rains also fell outside northeast Texas. Some of the largest monthly totals included 17.42 inches at Rodessa, La.; 12.49 at Onward, Miss.; 11.39 at Yuba, Okla.; and 17.75 inches at Stamps, Ark. Louisville, Ky., had rain on 23 days and a monthly total of 9.56 inches, the greatest amount on record there for April. The area of above normal rainfall extended eastward over the Appalachians from Pennsylvania through the Carolinas where March moisture had been much below normal. Moderate to heavy precipitation fell in South Dakota at intervals during the last 3 weeks, and in North Dakota the last week. This was the third consecutive month with above normal precipitation in the Dakotas. Major flooding which began in March, caused mainly by rapid snowmelt, gradually subsided during the rest of the month.

This was the second consecutive dry month in most of the Far West. In some sections dry weather has prevailed for 3 months or longer. Pendleton, Oreg., received only 0.08 inch for its second driest April. Prolonged dry weather in the Far Southwest caused a decline of ground water levels which were at record lows at the end of the month.

In the Northeast Drought area, New England received less than 50 percent of normal precipitation. Monthly amounts were also below normal in New York, New Jersey, and along the Atlantic coast southward. The drought intensified in Rhode Island, Massachusetts, Maryland, and Delaware.

SNOW.--Snowfall and precipitation were both well below normal in the Western States for April, continuing the trend begun in January. Above normal temperatures removed the snow cover faster than usual. The water supply outlook decreased over most of the West, and shortages were expected in most areas dependent upon streamflow. The only exception was a slight improvement in some areas of Montana, owing to above normal mountain precipitation. Heavy snows and above normal precipitation the last 2 months of 1965 helped maintain above normal amounts of water in reservoirs.

Snow, mostly light, fell in the Rockies at the beginning of the month, and flurries were reported from the northern Rockies to New England. The latter flurries persisted through the first decade.

A storm centered over the central Rockies April 18 brought heavy snowfall to a wide belt extending from Utah to Wisconsin. Lander, Wyo., reported 20 inches and over 20 inches fell in eastern Wyoming and the Black Hills of South Dakota.

DESTRUCTIVE STORMS.--A number of severe tornadoes crossed the central Florida Peninsula on April 4, causing 9 deaths, many injuries, and millions of dollars property damage. The nine fatalities were the greatest 1 day tornado death toll on record for the State. Damage was heaviest in the Tampa and Lakeland areas but extended eastward to Cocoa.

During a period of stormy weather around the 18th, 19th, and 20th, snow fell over a wide area from Utah to Wisconsin, and winds up to 60 m.p.h. whipped up dust in eastern New Mexico and the Texas Panhandle. Severe thunderstorms and a few tornadoes occurred in an area extending from lower Great Plains to the Great Lakes. Torrential rains in northeast Texas caused severe flash floods which were blamed for the death of at least 12 persons.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

°	Includes crop damage
C	Crop damage
R	Rain
L	Local flooding

* No occurrence of storms or unusual weather phenomena.
‡ Includes heavy sleet storm.
# Freezing drizzle and freezing rain, commonly known as glaze.
ø For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.

† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

APRIL 1966

Elmer R. Nelson, Office of Hydrology

Near record to record crests occurred in the Red River of the North Basin during April. At Grand Forks, N. Dak., the main stem crested slightly higher than in 1965 but 4.6 feet lower than the record crest of 1897. At Drayton, N. Dak., the Red exceeded the previous record crest by 1.7 feet. The total damages from the near record to record spring flooding in the Red River of the North Basin has been estimated at nearly $8 million.

Severe flash flooding occurred in northeastern Texas in the Sabine and Trinity Basins during the latter part of April. The American Red Cross reported 27 deaths due to drowning in this area. Property damages were heavy.

The worst flooding since 1961 occurred in the White Basin in Arkansas. Severe flooding occurred in the Red Basin in Arkansas with the Ouachita and tributaries reaching its highest stage since 1958.

HUDSON BAY DRAINAGE

Red River of the North Basin.--The Sheyenne River at West Fargo, N. Dak., had risen to a stage of 19.6 feet by April 1, 3.6 feet above flood stage. It crested on April 3, at a stage of 20.4 feet. This was 0.4 foot below the record stage of 20.75 feet of April 1965. It receded back within its banks on the morning of April 12.

The Red Lake River near High Landing, Minn., crested at a stage of 12.4 feet on April 3. This was 0.3 foot higher than the 12.1 feet crest of April 1965 and 1 foot lower than the record 13.4 feet crest of May 1950. Farther downstream at Crookston, Minn., the Red Lake River reached a crest of 24.3 feet on April 3. This was 1.5 feet lower than the record crest of 1965.

The main stem of the Red River of the North was 6 to 10 feet above flood stage in the reach from Fargo, N. Dak., to Halstad, Minn., and receding on April 1. The crest of 30.10 feet at Fargo on March 23, 1966 was nearly 0.5 foot lower than the crest of 1965 and 10 feet lower than the record crest of 1897.

At Grand Forks, N. Dak., city officials had earlier made tentative plans to protect the city against high water. After the severe blizzard an expanded program for protection against expected high water was started immediately. Across the river at East Grand Forks, Minn., city officials had declared a "flood emergency" even before the severe blizzard of March 3-5, 1966. They were determined to avoid a repetition of the severe flooding of 1965 and had started the construction of a temporary clay dike. In both cities, the snow was scraped away from the areas in which dikes were to be built. Sand for filling burlap bags was hauled and stockpiled in the Riverside and Central Park Areas. A month later, sandbag dikes were higher than the snowdrifts. School children, University of North Dakota students, Air Force personnel, and citizens responded to pleas for volunteer labor to help build the dikes. Water spread across golf courses, parks, roads, and rich farmlands, but the dikes held in Greater Grand Forks and most other communities throughout the valley. Many families left their homes as a precaution against a sudden break in the emergency flood walls, but relatively few homes were flooded. The crest of 45.6 feet at Grand Forks, N. Dak., on April 4 was 1.7 feet higher than the 44.9 feet crest of 1965. It was the third highest crest of record and was 4.6 feet below the 50.2 feet record crest of 1897.

At Drayton, N. Dak., the Red River of the North reached a record crest of 42.15 feet on April 8, 1966. This was 1.7 feet higher than in 1965.

At Pembina, N. Dak., near the Canadian border, the main stem went above flood stage on April 2. It crested on the 11th and 12th at a stage of 51.3 feet, 9.3 feet above flood stage. This was nearly 4 feet above the flood level of 1965, but 1.6 feet below the record crest of 1950.

At town after town, volunteers turned out to build dikes to protect the towns from flood damage. At Alvarado, Minn., the Snake River overflowed its banks with such suddenness that emergency dikes could not be completed in time. Water several inches to several feet deep flowed around homes and business places throughout the village.

ATLANTIC SLOPE DRAINAGE

April was rather cool and dry through New England with precipitation amounts well below normal. The only substantial rains occurred during the latter part of the month, averaging 1 to 1 3/4 inches with lesser amounts in northern sections. Even though stream flows increased during March and April due to snowmelt, the Connecticut Basin at Hartford, Conn., averaged 5 feet below the 60-year mean. This was the 6th lowest April stage in 62 years.

The only flooding in the Atlantic Slope Drainage during April was on the Savannah River at Clyo, Ga., which went above flood stage on February 20. It receded within its banks on April 4.

EAST GULF OF MEXICO DRAINAGE

The Apalachicola River which went above flood stage at Blountstown, Fla., on March 29 receded within its banks on April 2. It crested on the 1st, 1.7 feet above flood stage. Heavy rain (1 to 1.5 inches) on the 3d-4th caused another rise to above flood stage on the 7th. It remained out of its banks at Blountstown until the 9th. The small extent of flooding was limited to wooded and unpopulated areas. No damages were reported.

The Coosa River at Gadsden, Ala., was rising and slightly above flood stage at the end of the month.

Heavy rain during the last 10 days of the month in Mississippi, Alabama, and Louisiana caused some tributary streams in the Tombigbee Basin and the main stem of the Pearl River to overflow. Tibbee Creek at Tibbee, Miss., was in flood from April 28 to May 2 and crested 2.5 feet above flood stage on April 30. Noxubee River at Macon, Miss., overflowed slightly on the 28th. The Black Warrior River at Tuscaloosa, Ala., crested nearly 4 feet above flood stage on the 28th. Farther downstream at Warrior Lock and Dam, Ala., the river was out of its banks from April 29 to May 2.

The Pearl River rose out of its banks at all points from Edinburg, Miss., to Pearl River, La., between the 23d and 30th and was still in flood at all points at the end of the month, but receding. The crests occurred between the 28th and 30th and ranged up to 11 feet above flood stage at Jackson, Miss. Losses in the Pearl Basin were mostly agricultural and to road construction. Preliminary estimates indicate that the losses will be less than $1/2 million.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--There was practically no snow or rain during the first 17 days of April in the Minnesota and Wisconsin portion of the upper Mississippi Basin. Temperatures were normal or below during this period. The cold weather during the first week in April retarded the snowmelt rise which started late in March.

The Minnesota River, near Savage, Minn., which went out of its banks on March 17, continued in flood until April 14. The crest on April 8 was slightly higher than the one on March 24, and exceeded flood stage by 2.4 feet. Further downstream at Mendota, Minn., the river approached within 0.4 foot of flood stage on March 24. The secondary crest on April 8 was about 1 foot lower.

Heavy rains from the 18th through the 23d in Illinois and Missouri caused rapid rises with the Sangamon at Riverton, Ill., and the Meramec River at Pacific, Mo., overflowing their banks beginning on the 22d. The Kaskaskia River in Illinois and the Bourbeuse at Union, Mo., rose above flood stage on the 23d. The Big Muddy River at Murphysboro, Ill., began overflowing on the 24th, cresting on the 30th, 9.1 feet above flood stage. It was still in flood at the end of the month but receding. The Illinois River went out of its banks at Meredosia, Ill., on the 23d. Additional rainfall on the 26th and 27th caused the Illinois River to rise above flood stage from Morris, Ill., to Beardstown, Ill. The stream was still in flood at the end of the month and rising. Damages from flooding in Missouri and Illinois are expected to be minor.

Snow fell over the upper Mississippi and the upper Minnesota Valleys late on the 17th and 18th. Eight to 11 inches of new snow with a water equivalent of 0.75 to 1.18 inches, was reported at Wadena and Park Rapids, Minn., on these dates. Additional precipitation, ranging from 0.5 to 1.5 inches, in the form of rain occurred over Minnesota and Wisconsin, from the 18th through the 20th. Below normal temperatures followed thereby holding runoff to a minimum. The Mississippi crested at Libby at a stage of 15.8 feet, 2.8 feet above flood stage on the 25th. The crest moved downstream to Aitkin, Minn., on the 30th and topped its banks by 1.7 feet. The Mississippi was still rising at Fort Ripley, Minn., on April 30, but crested on the following day, 1.4 feet above flood stage. The only other flooding along the main stem occurred 550 miles downstream at Keithsburg, Ill., from March 29 to April 8. Damage is expected to be light in the Libby-Aitkin, Minn., areas as the overflow area was mostly forested and/or agricultural land.

Missouri Basin.--The James River was overflowing its banks throughout most of the month from near La Moure, N. Dak., to Ashton, S. Dak. The highest overflow occurred at Columbia, S. Dak., where the crest on April 1-3 was 5.2 feet above flood stage. The crest reached Stratford, S. Dak., on the 11th, and was nearly 3 feet over its banks. The crest at Ashton, S. Dak., on the 14th and 15th was 2.2 feet above flood stage. Flooding was still occurring in this reach at the end of April. At Redfield, S. Dak., the James was out of its banks from the 12th to the 22d. The main loss from the flooding will be agricultural. The total damages, including loss of farm levees, flooding of some farm buildings, and damages to roads and bridges will range from $1/2 to $3/4 million. As much as 40,000 acres of land is estimated to have been flooded with some of the most widespread flooding from around Columbia downstream to Stratford, S. Dak.

Light flooding occurred on Lyon Creek at Woodbine, Kans., and on Marais Des Cygnes at Reading, Kans., from 1 to 2 inches of rain on the 11th and 12th. Rainfall of 3 inches was reported in the Randall area of north-central Kansas on the morning of the 11th. Locally heavy rain inundated the highway between Beloit and Jewell on this same date. Damages from the slight overflows were negligible.

Ohio Basin.--Minor flooding occurred on the lower Scioto at Piketon, Ohio, on the 29th. Other than slowing down progress in agricultural work, no damage resulted from this overflow.

Heavy rains on the 26th and 27th caused the Muscatatuck River at Austin, Ind., to rise a little above bankfull stage during the latter part of the month. No damage resulted.

There were two minor overflows along the Saline River at Harrisburg, Ill., during April. The first resulted from 1.5 to 2 inches of rain on the 12th and 13th. The second was due to 3 to 3.5 inches from the 23d to the 30th. This storm also caused minor flooding along the Skillet Fork and Little Wabash Rivers at Wayne City and Wilcox, Ill.

White Basin.--Moderate rains on the 18-20th followed by heavy rains on the 22d to the 23d caused the worst flooding in the White Basin in Arkansas since 1961. The Cache River at Patterson, Ark., went above flood stage on the 21st, cresting at a stage of 10.4 feet, 1.4 feet above flood stage, on the 30th. The Black River at Black Rock, Ark., went above flood stage on the 23d, cresting nearly 11 feet above flood stage on the 25th. The main stem of the White began overflowing on the 24th and crested in the reach from Batesville to Georgetown, Ark., from the 24th to the 30th, up to 3 feet above flood stage. It was still rising in the reach below by the end of the month. The damages from the flooding will total nearly $2 million.

Arkansas Basin.--Lowland flooding was experienced in the extreme eastern portion of Oklahoma, between the 24th and 27th. The Illinois River crested at Watts, Okla., 0.4 foot above flood stage on the 24th. The crest reached Tahlequah, Okla., on the 25th and exceeded bankfull stage by 1.2 feet. The Poteau River crested 4.6 feet above flood stage at Panama, Okla., on the 25th. This flooding was due to moderate to heavy precipitation.

Red Basin.--Severe flooding occurred on the Ouachita and tributaries in Arkansas from moderate rains, beginning on April 21. The heaviest rains occurred on the 24th, 26th, 29th, and 30th. The Ouachita and tributaries reached its highest stage since 1958 and was still rising at the end of the month. Smackover Creek at Smackover (below Camden), Ark., approached within 0.3 foot of the record stage. Ouchita County and surrounding counties were declared disaster areas. The Caddo at Glenwood, the Little Missouri at Broughton, Ark., and the Saline at Benton, Ark., overflowed briefly during the last week of April. The preliminary estimates of damages on the Ouachita were about $600,000.

Seven to 9 inches of rain from the 22d to the 26th caused the Sulphur to overflow at Hagansport, Ark., on the 24th and at Naples, Tex., on the 25th. The Cypress at Jefferson, Tex., went out of its banks on the 25th, cresting on the 27th, 3.5 feet above flood stage. Four to 5 inches of additional rain on the 29th and 30th caused the Little and Sulphur Rivers to continue rising at the end of the month.

Lower Mississippi Basin.--The St. Francis River at Fisk, Mo., and St. Francis, Ark., reached its highest level since March 1964. The crest at Fisk of 24.8 feet on the 30th and the one at St. Francis of 21.8 feet on May 1-3, were 0.2 foot below the 1964 flood. The amount of damage from this flood will depend upon the time it takes to recede. About 100,000 acres of farmland in the Fisk-St. Francis area was inundated. Much of the farmland had been plowed but very little had been seeded. This flooding was due to heavy rainfall on the 18th, 20th, 23d, and 26th. Twenty-four hour totals of 1 to over 2 inches were common on those days.

The heavy rain on the 20th and 21st caused the Big

Black River at Pickens and Bovina, Miss., to rise above flood stage on the 21st. It receded below flood stage at Bovina on the 22d and at Pickens on the 24th. Additional heavy rains caused the Big Black to overflow its banks again at Bovina on the 26th and at Pickens on the 29th. The stream was still in flood at the end of the month. Damages from the flooding, due to the time of the year, are expected to be moderate.

WEST GULF OF MEXICO DRAINAGE

Heavy rains caused the Mermentau River at Mermentau, La., to rise slightly above flood stage on the 23d-25th. The Calcasieu River exceeded flood stage at Hineston and Kinder, La., between the 27th and 29th.

Severe flash flooding occurred along the smaller tributaries of the Sabine River in Texas, beginning on the 24th, resulting in evacuations of residents from low-lying areas and at least 12 deaths. The main stem of the Sabine went over its banks at Edgewood and Gladewater, Tex., on the 24th. By the 25th, the Sabine was in flood from Quitman to Tatum, Tex. Crests on the 27th ranged up to nearly 12 feet above flood stage at Gladewater, Tex. Overflow began at Logansport, Tex., on the 28th and by the end of the month the river had risen to 8 feet above flood stage. Flooding continued at all points into May. This flooding was due to excessive rains from the 23d to the end of the month. Gladewater, Tex., reported 22.74 inches of rain in 60 hours. The greatest 24-hour amount reported was 9.65 inches at Gladewater on the 23d.

The Neches River near Alto, Tex., went out of its banks on the 25th, cresting on the 30th 7.4 feet above flood stage. It continued in flood into May. The Angelina River near Alto, Tex., went above flood stage on the 26th and continued above bankfull stage into May. It crested on the 28th, 2.4 feet above bankfull stage. These overflows were due to excessive rains from the 23d to the end of the month.

Flash flooding began on some of the smaller streams in the Trinity Basin in Texas on the 23d. The main stem at Dallas and below, and the East Fork, Chambers Creek, Cedar Creek, and Richland Creek began overflowing on the 24th. These streams remained above flood stage throughout the remainder of the month except for a brief fall below flood stage at Dallas, Tex., on the 27th. The excessive rains on the last 3 days of the month, falling on a basin with very wet soil and swollen streams, resulted in a total runoff comparable to the record floods of 1957 and 1908. Stages on the Trinity River did not reach the high marks of those floods because of flood control storage and improved floodways in the upper portion. The USGS reported that on the 28th, Joe's Creek in Dallas crested 2 feet higher than the highest flood since 1900. Bachman Branch, in Dallas, crested 5 feet higher than the highest known flood. Highest known floods were recorded at five gaging stations on small drainage areas in Dallas on that date. This severe flooding was due to heavy rains which began over the upper Trinity Basin on the 22d and continued into the 26th. These heavy rains were followed by periods of excessively heavy rain from the evening of the 27th which continued into May 1. During the early hours of the 28th, WBAS, Dallas, measured 2.51 inches of rain in a 1 hour period. In the northeast portion of Dallas, USGS indicated falls in excess of 6 inches per hour. During the 10-day period, precipitation in the Trinity Basin ranged from 6 to more than 20 inches. Damage was extensive and continued into May. Preliminary estimates of flood damage in the upper Trinity are in excess of $15 million, with a major portion of this occurring in the metropolitan areas of Dallas and Tarrant Counties. There was considerable damage in rural areas to roads, utilities, agricultural interests, and limited industrial interests. Fifteen deaths resulted from drownings during this storm period.

The Little and Navasota Rivers, tributaries of the Brazos, went above flood stage on the 25th and the Navasota River continued in flood near Bryan, Tex., through the 29th. The Little River crested at Cameron, Tex., on the 25th over 5 feet above flood stage. The Navasota River crested 6.3 feet above bankfull stage on the 26th and 4.2 feet above flood stage near Bryan, Tex., on the 28th. The only flooding along the Brazos River occurred in the lower portion at East Columbia, Tex., beginning on the 30th and was due to runoff from the Little and Navasota Rivers.

Minor flooding occurred on the Navidad River at Ganado, Tex., on the 26th-28th and on the Lavaca River at Edna, Tex., on the 26th and 27th. This flooding was due to 2 to 3 inches of rainfall on the 24th and 25th. Runoff was heavy as this storm was preceded by 1 to 2 inches of rain during the period from the 17th through the 22d. No damage was reported from the flooding.

The flooding on the lower Atascosa and the lower Frio Rivers in Texas between the 25th and 28th was due to 3 to 5 inches of rainfall on the 24th. The flooding on the Nueces River near Tilden, Tex., beginning on the 27th was due to 2 to 4 inches of rainfall in the upper portion. The Nueces continued in flood into May, cresting 4.6 feet above flood stage on May 7-8. Damage from the overflows were relatively minor.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. They were also equipped with carbon hygristors. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.C.T.

R More than half of the observations are from statistical values.

Note: All observations are scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available.

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from lithium chloride hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes: dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots.

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun.

HI	Intense haze	M	Moderate haze - indeterminable
( )	Clouds present	*	Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

APRIL 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	165	37	245	233	253	242	140	268	215	225	159	258	317	242	147	25	221	179	236	248	233	301	173	306	177	34	226	239	276	327		212

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

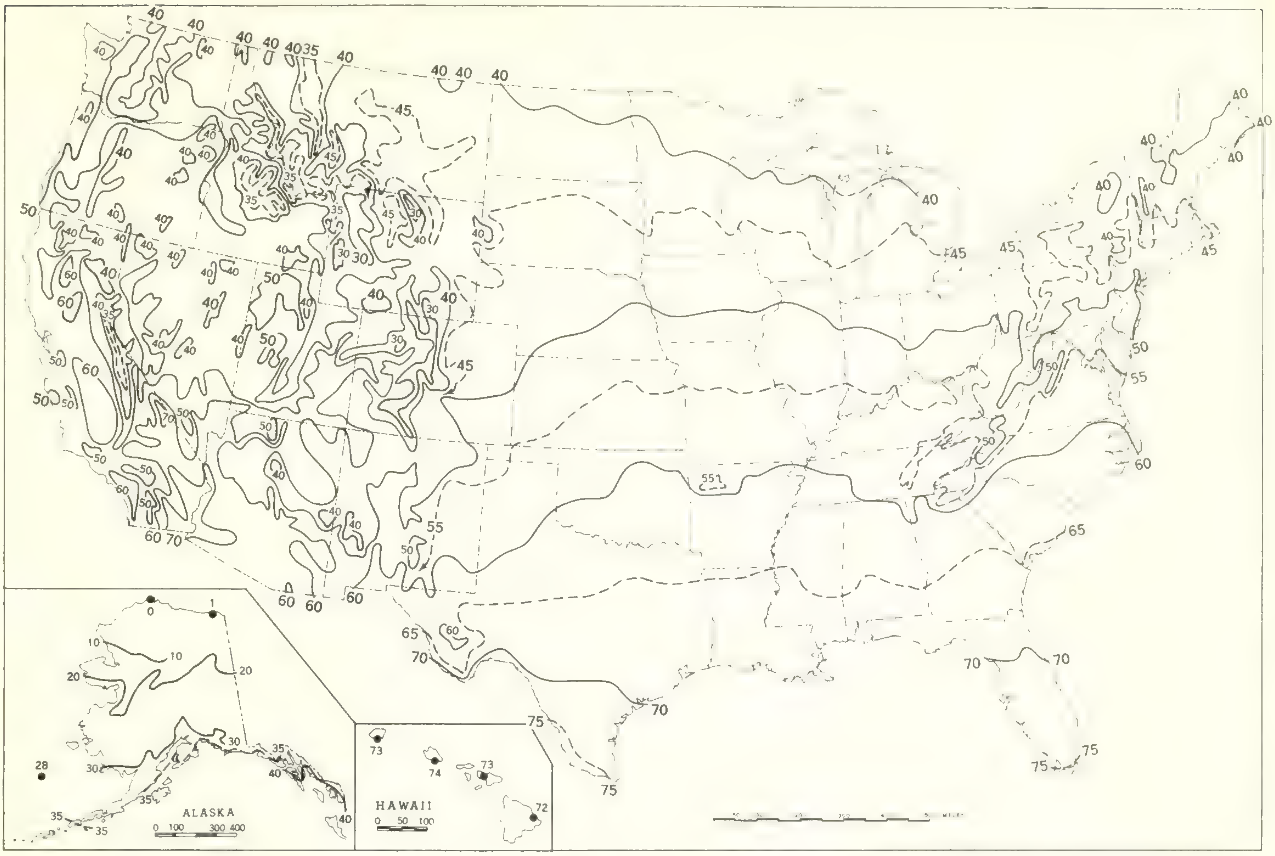
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ʌ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

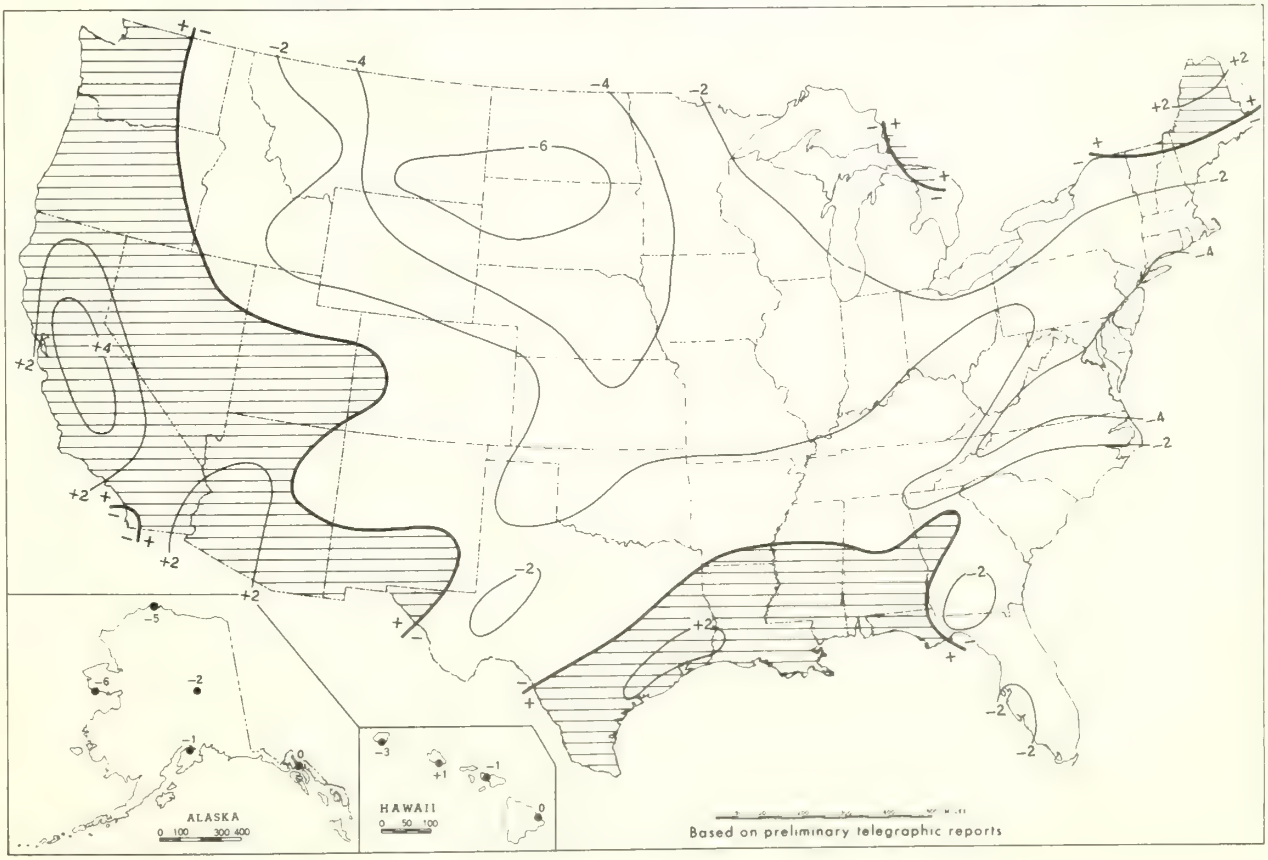
Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g , 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick The code ʌ s designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), April.

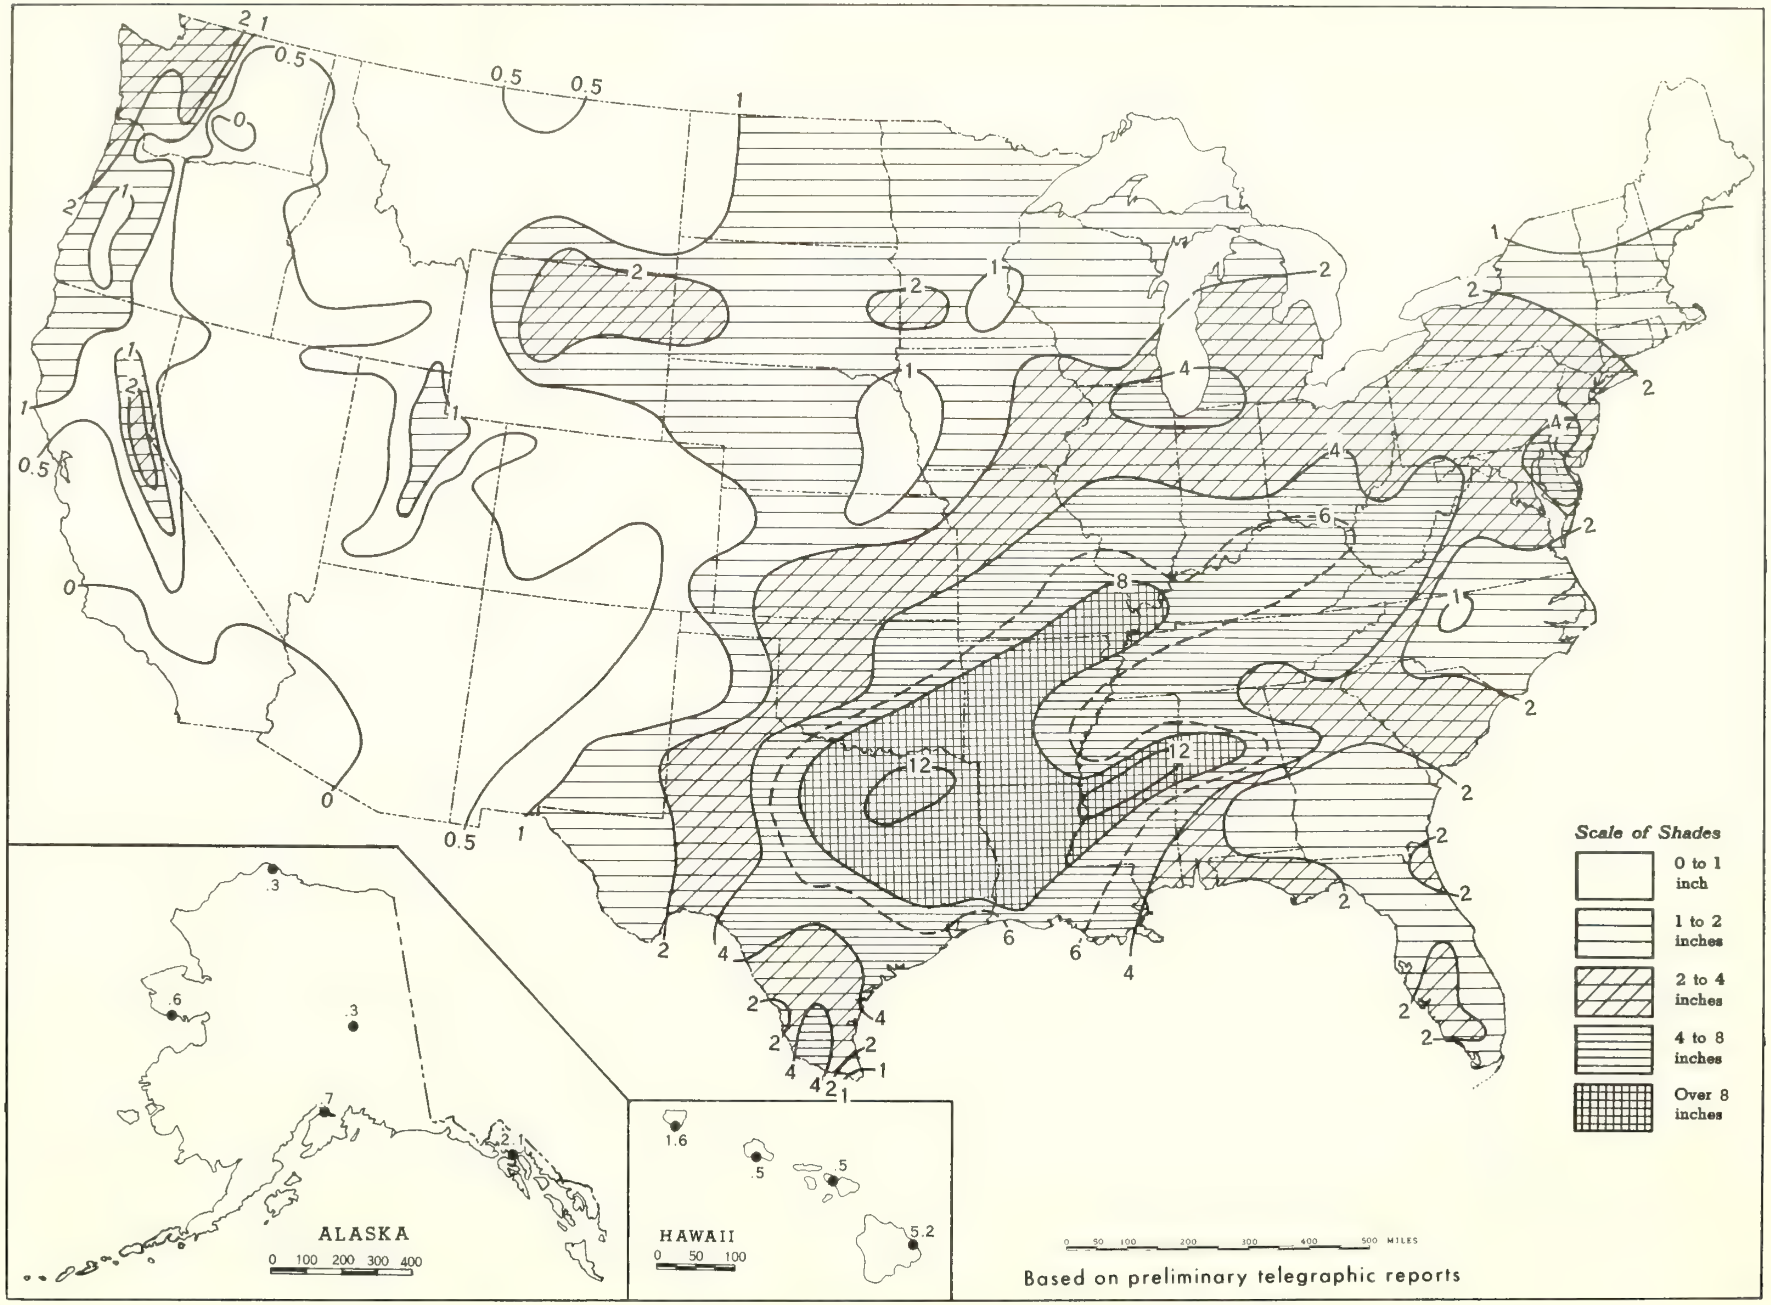


B. Temperature Departure from 30 - Year Mean (°F 1931-60), April 1966.



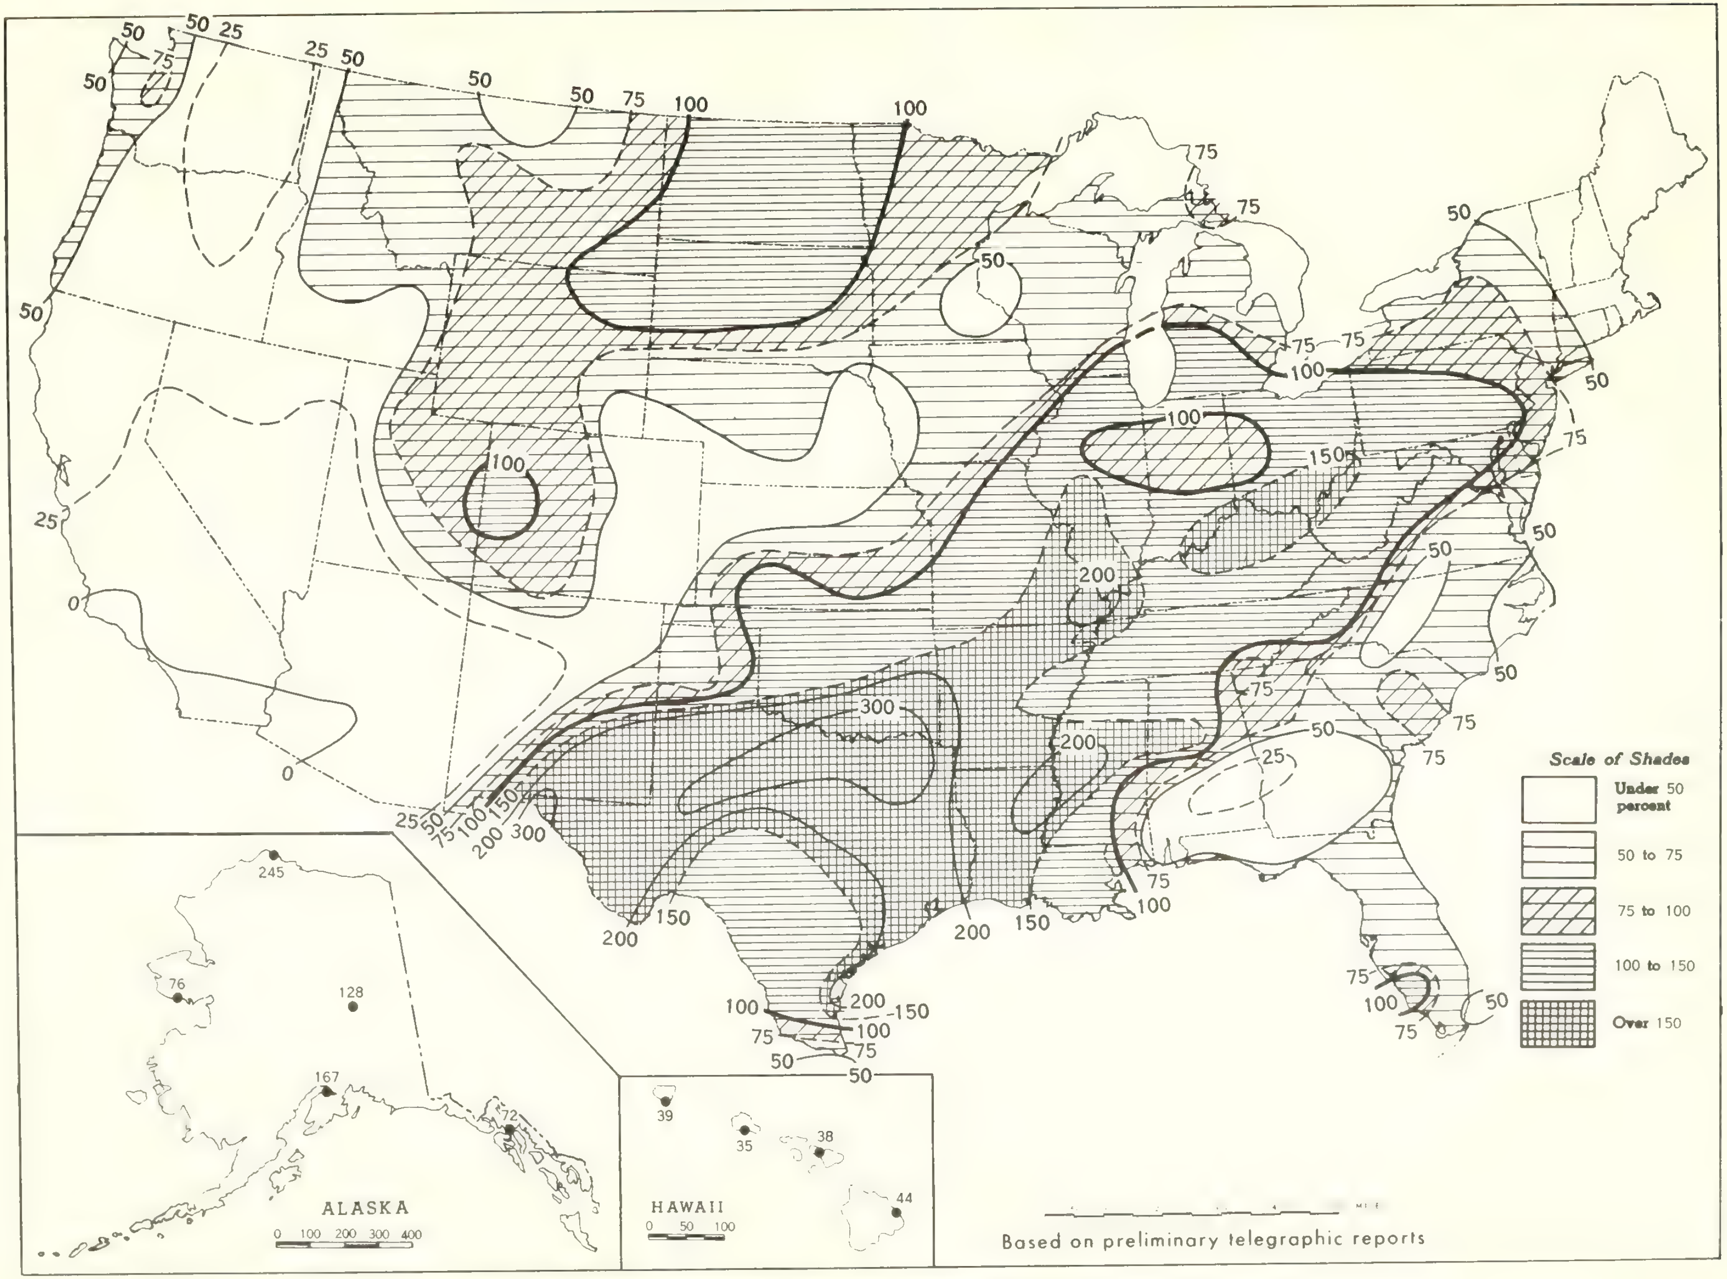
Based on preliminary telegraphic reports

Chart II. Total Precipitation (Inches), April 1966.



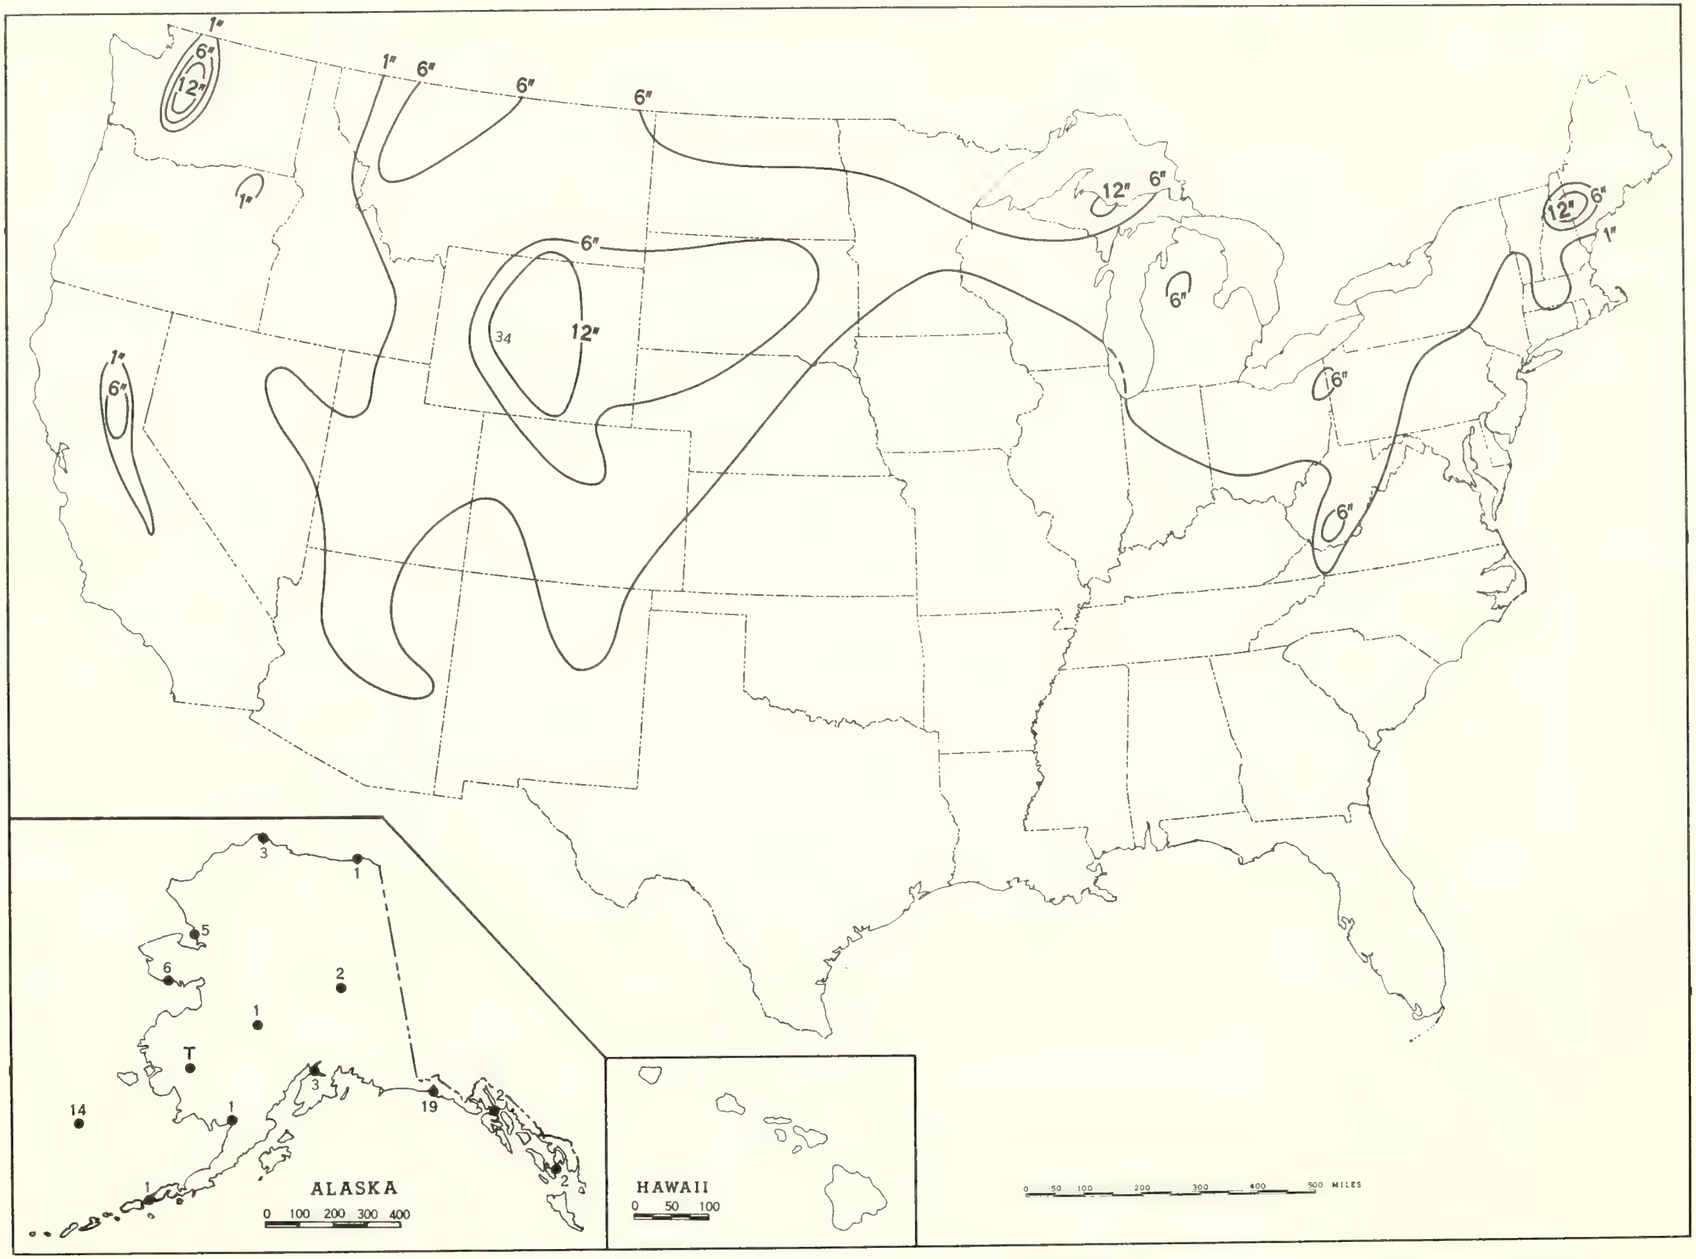
Based on preliminary telegraphic reports

Chart III. Percentage of Normal Precipitation, April 1966.



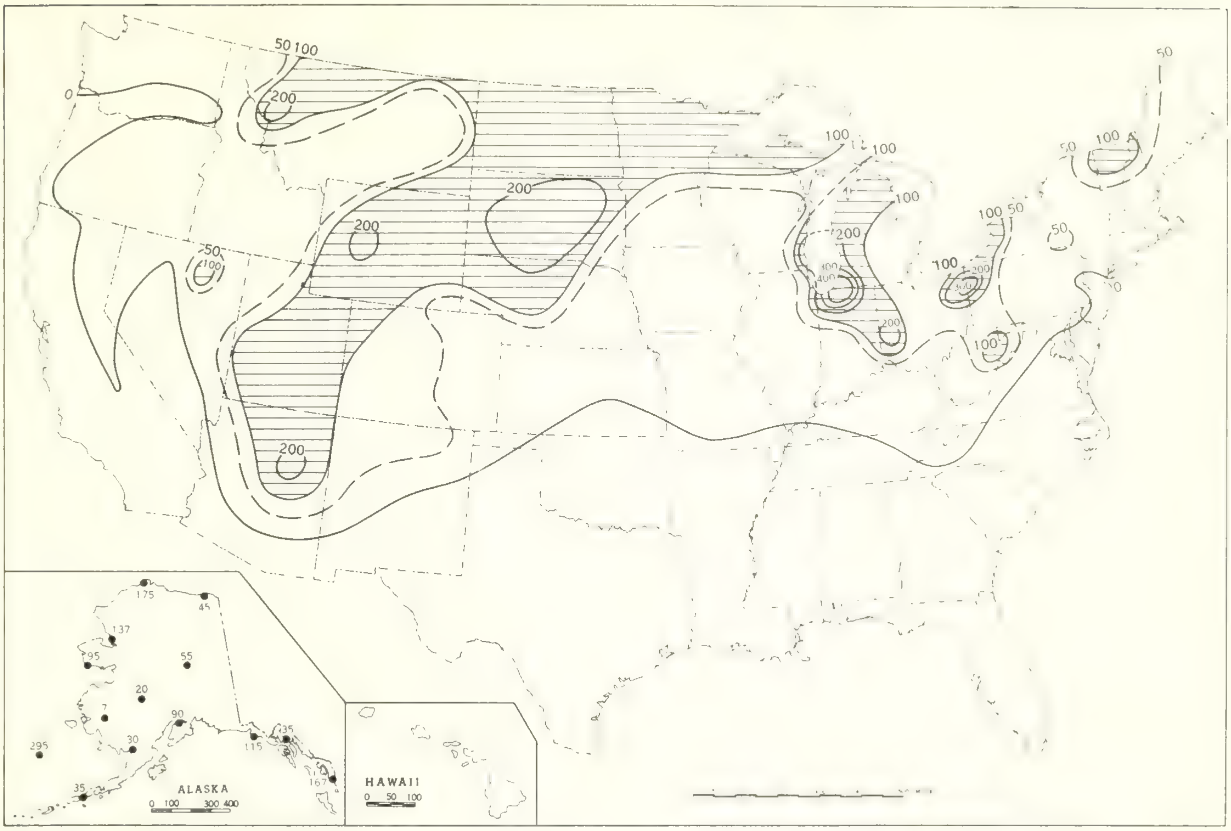
Normal monthly precipitation amounts are computed from 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart IV. Total Snowfall (Inches), April 1966.

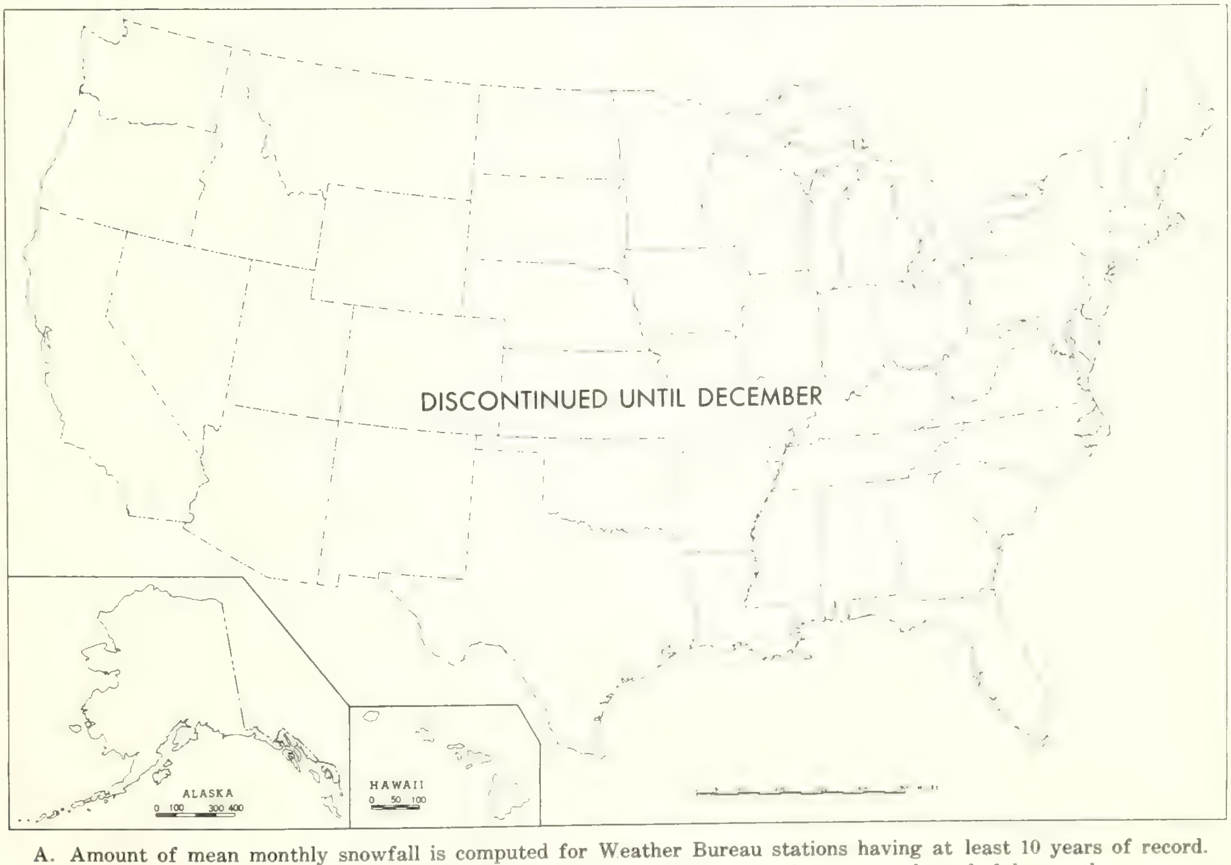


This is the total of unmelted snowfall recorded during the month at Weather Bureau and cooperative stations. This chart and Chart V are published only for the months of November through April although of course there is some snow at higher elevations, particularly in the far West, earlier and later in the year.

Chart V. A. Percentage of Mean Monthly Snowfall, April 1966.

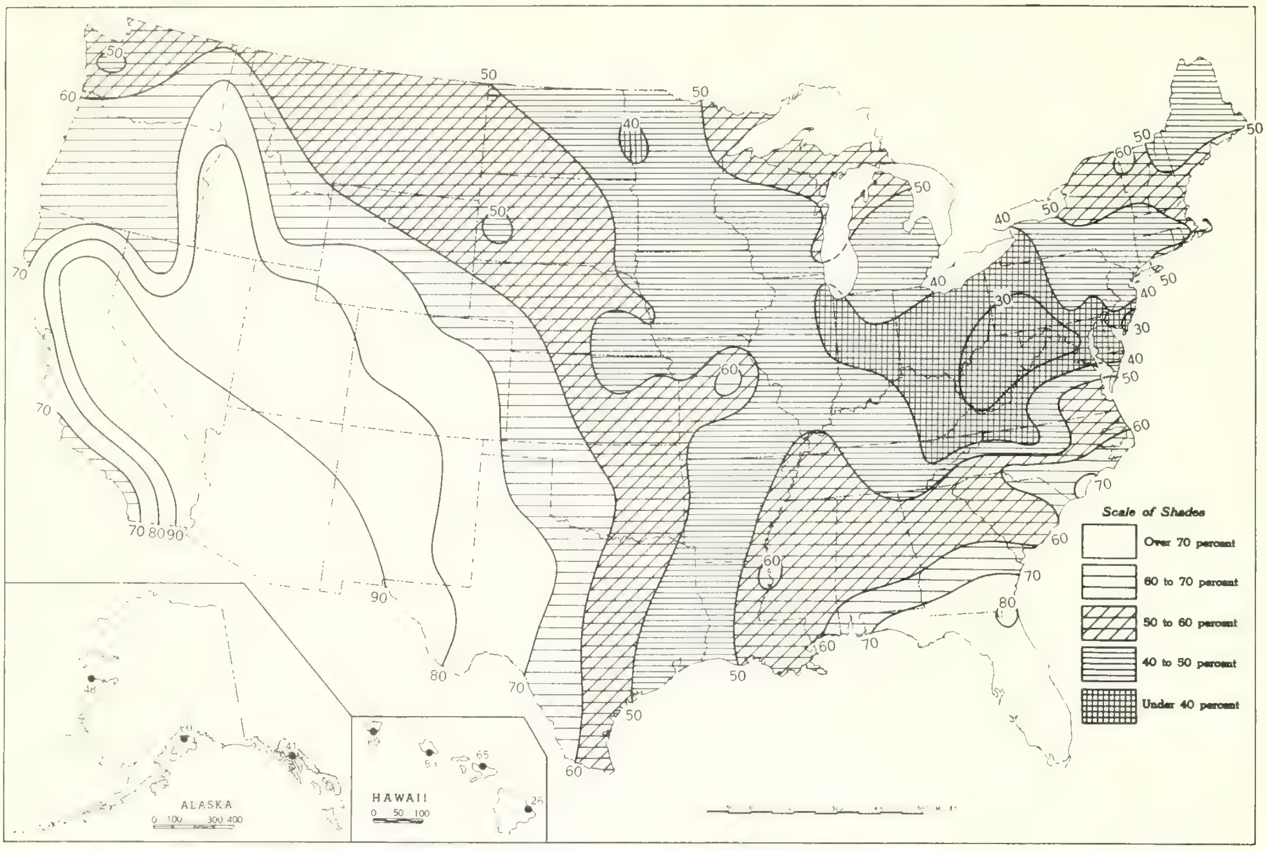


B. Depth of Snow on Ground (Inches), 7:00 a. m. E. S. T., April 1966.

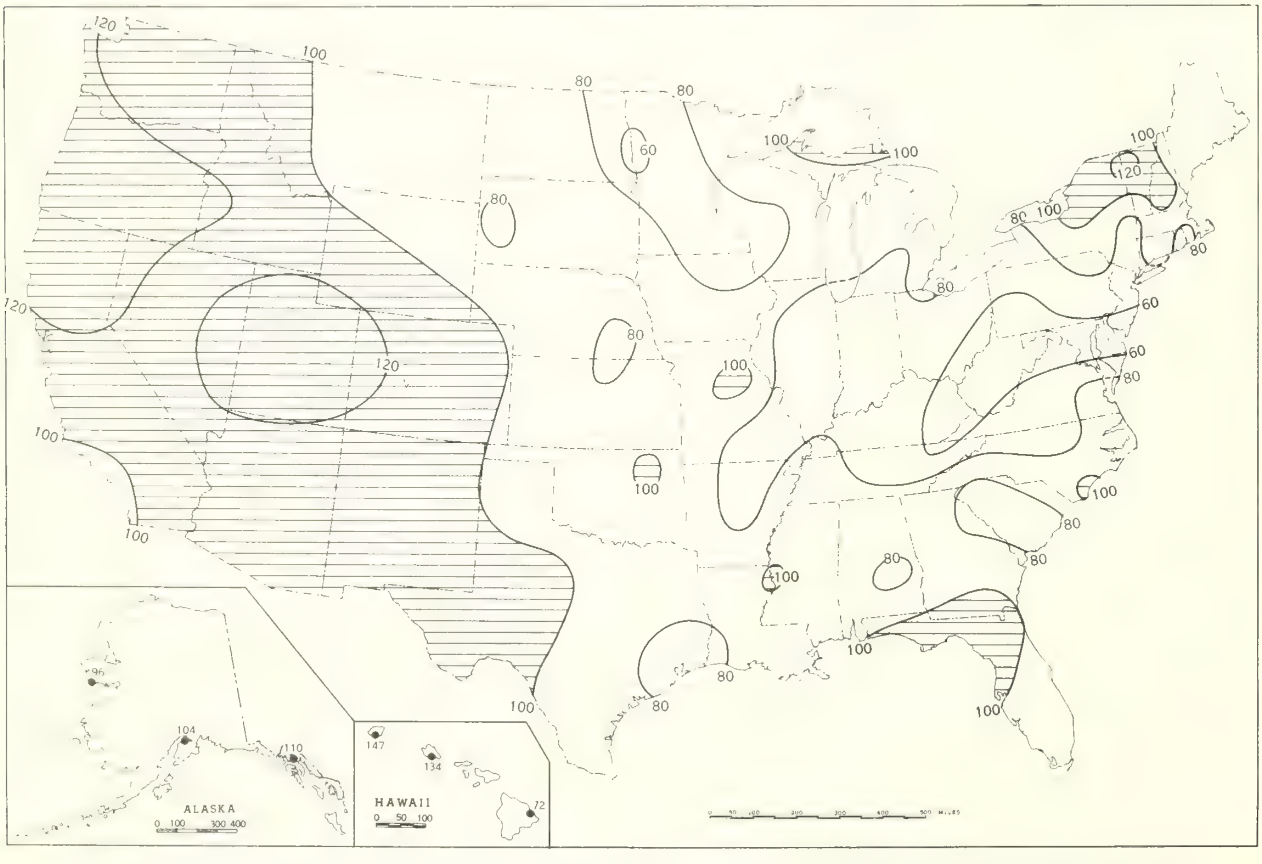


A. Amount of mean monthly snowfall is computed for Weather Bureau stations having at least 10 years of record.
B. Shows depth currently on ground at 7:00 a.m. E.S.T., of the Monday nearest the end of the month.
It is based on reports from Weather Bureau and cooperative stations.

Chart VI. A. Percentage of Possible Sunshine, April 1966.

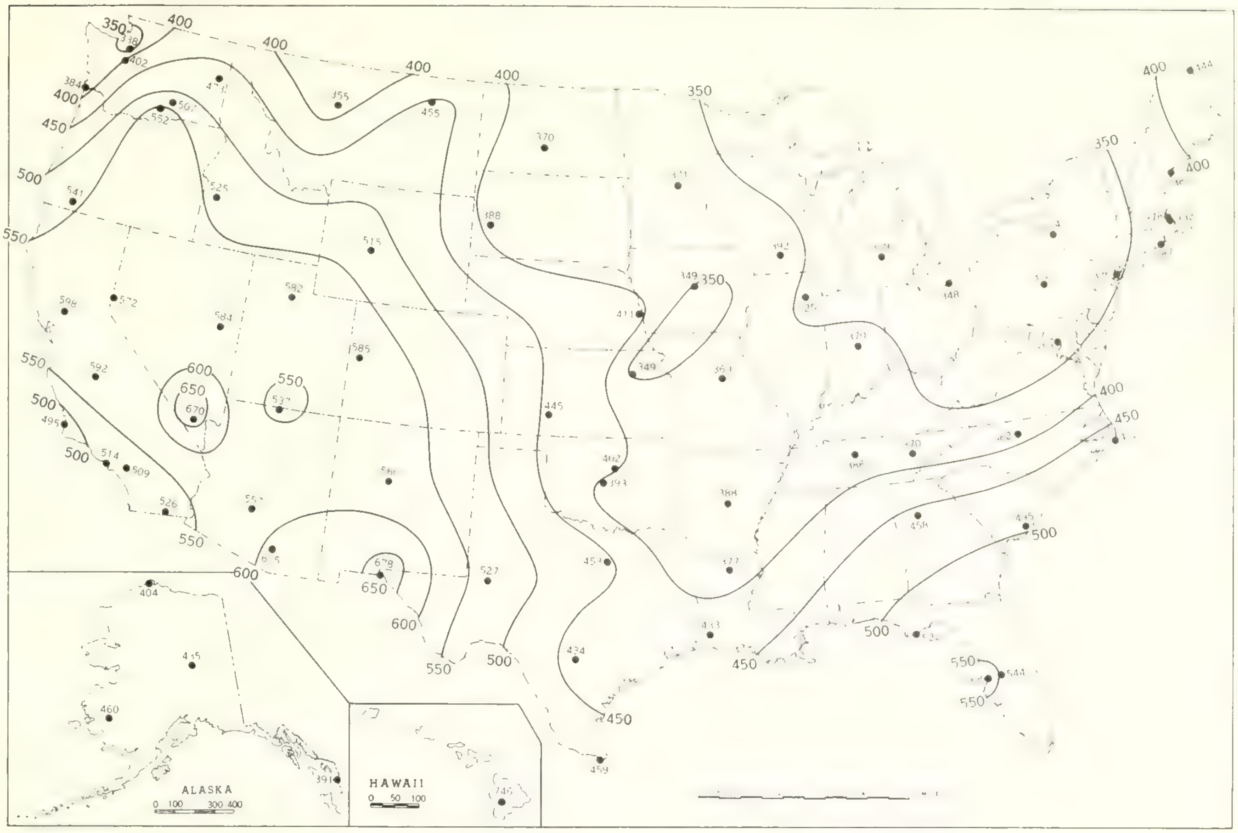


B. Percentage of Mean Monthly Sunshine, April 1966.

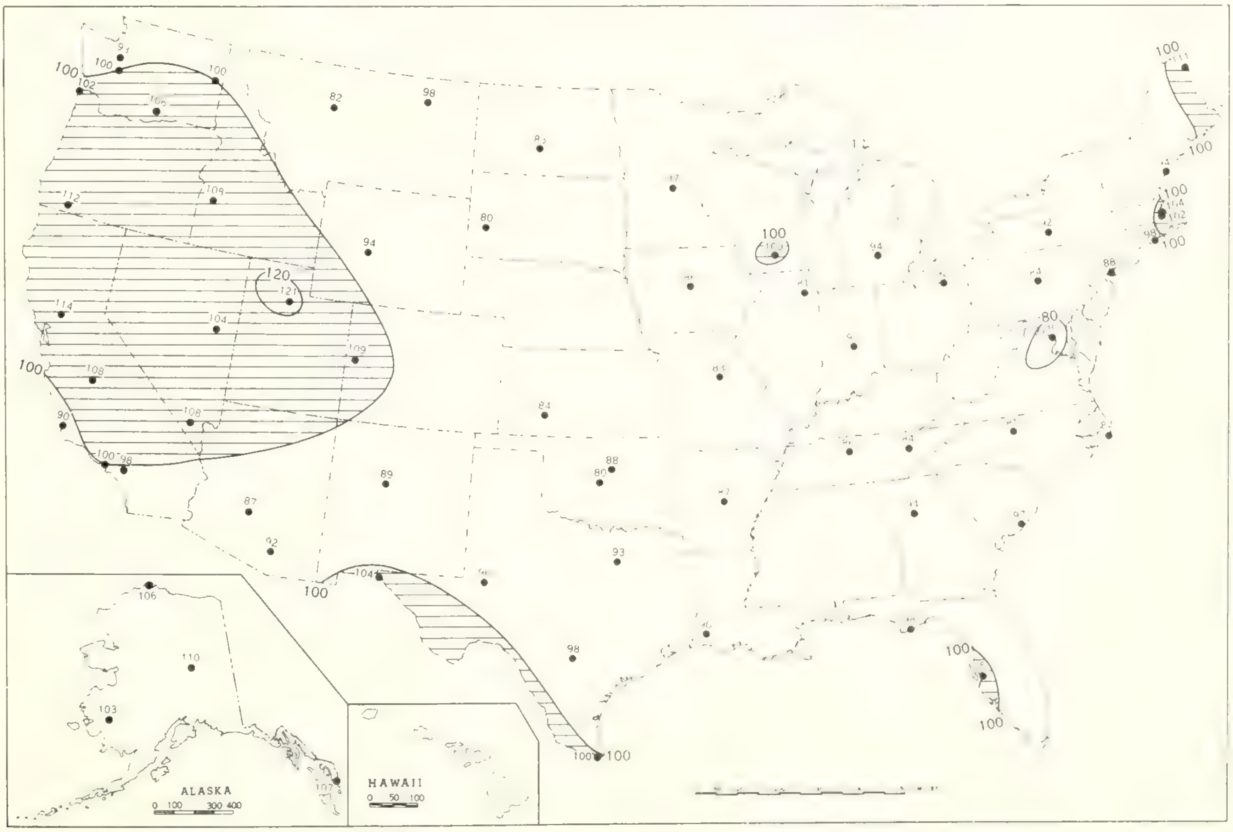


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, April 1966.

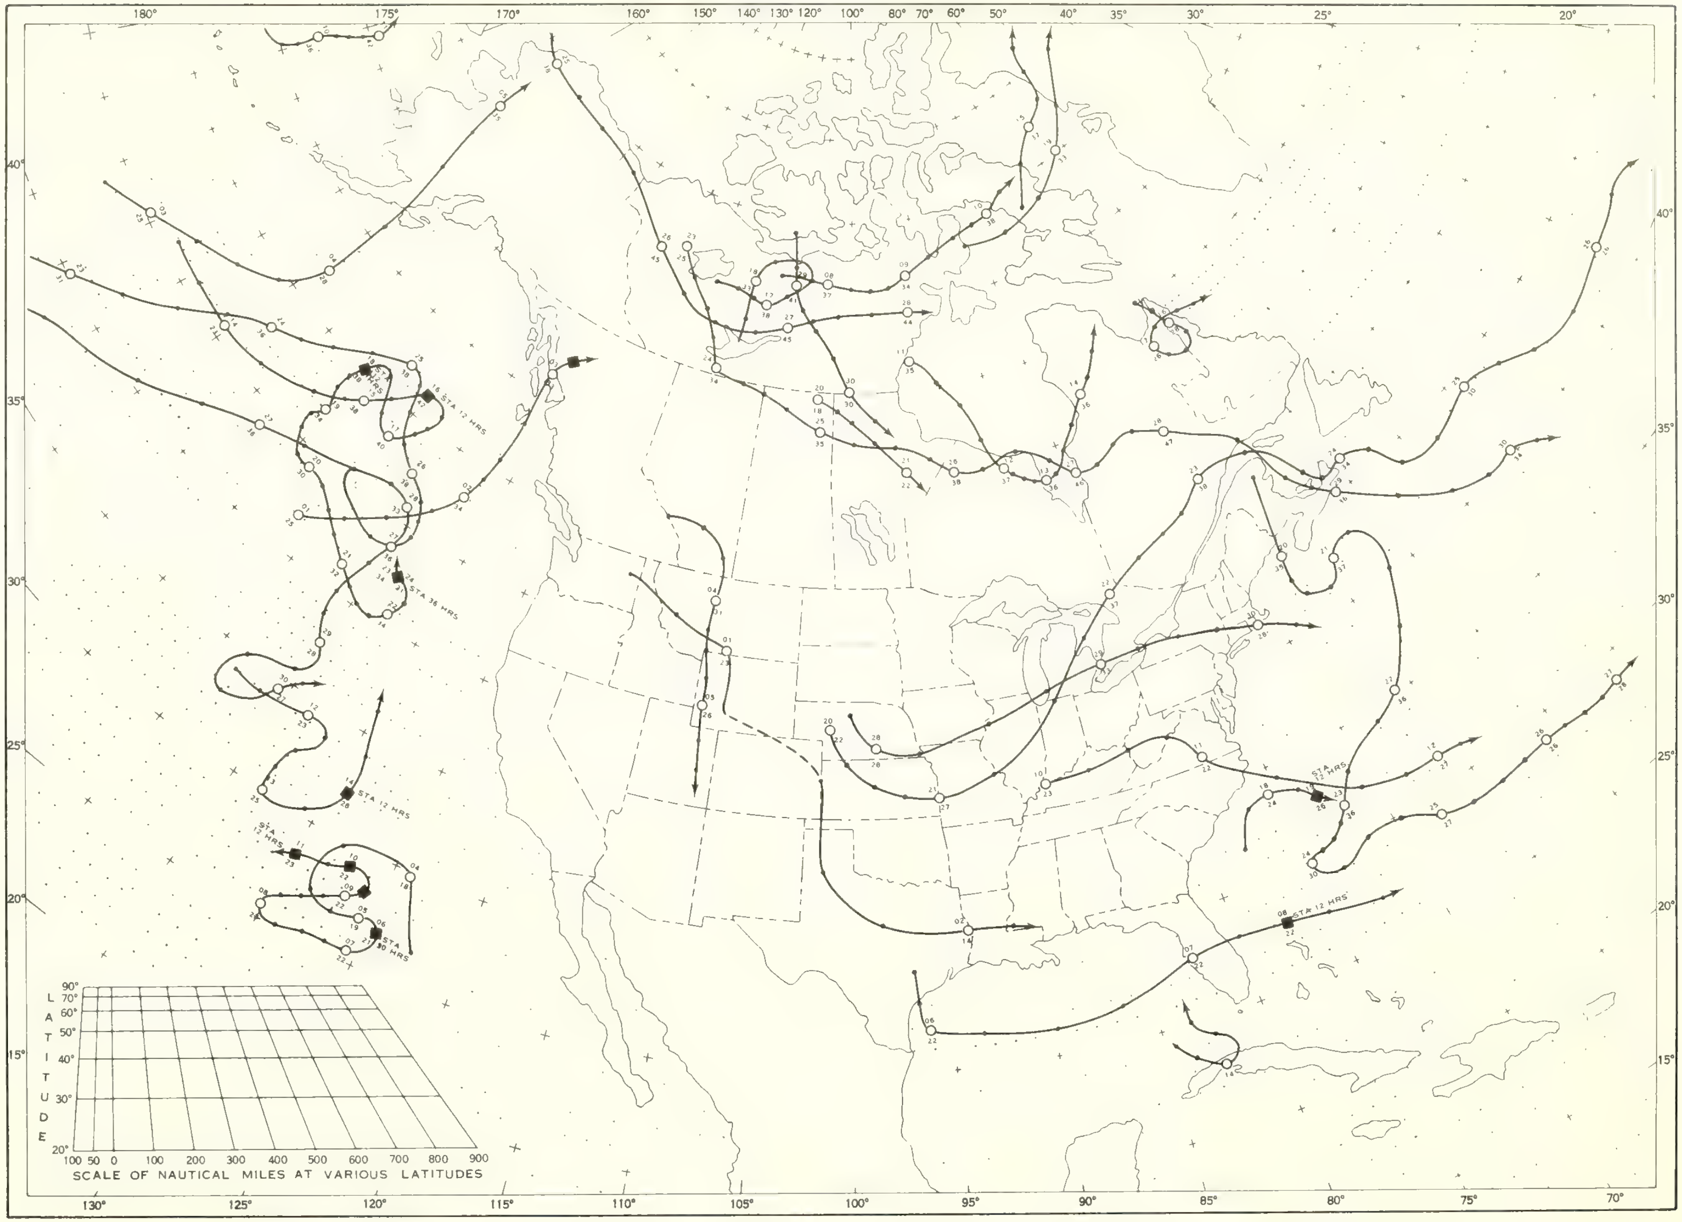


B. Percentage of Mean Daily Solar Radiation, April 1966.



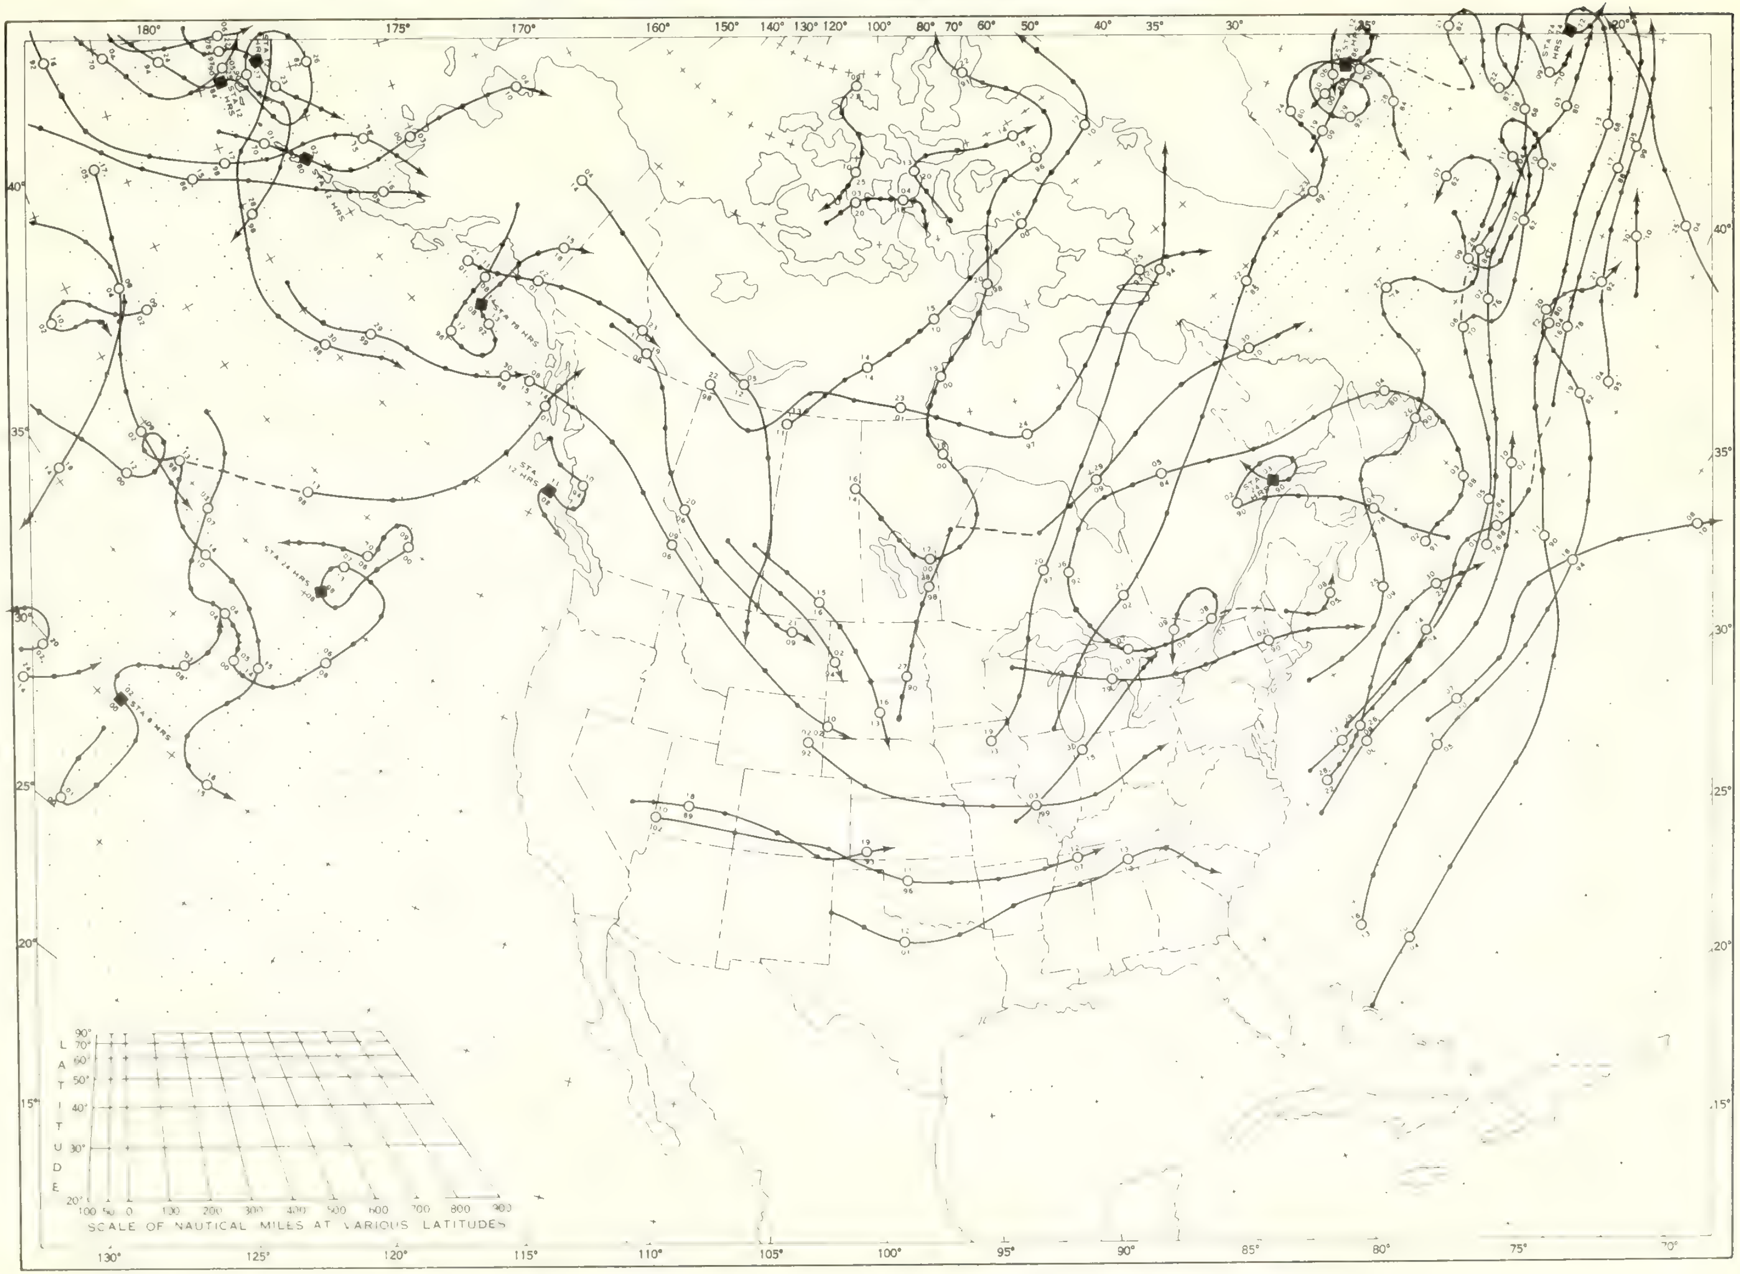
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, April 1966.



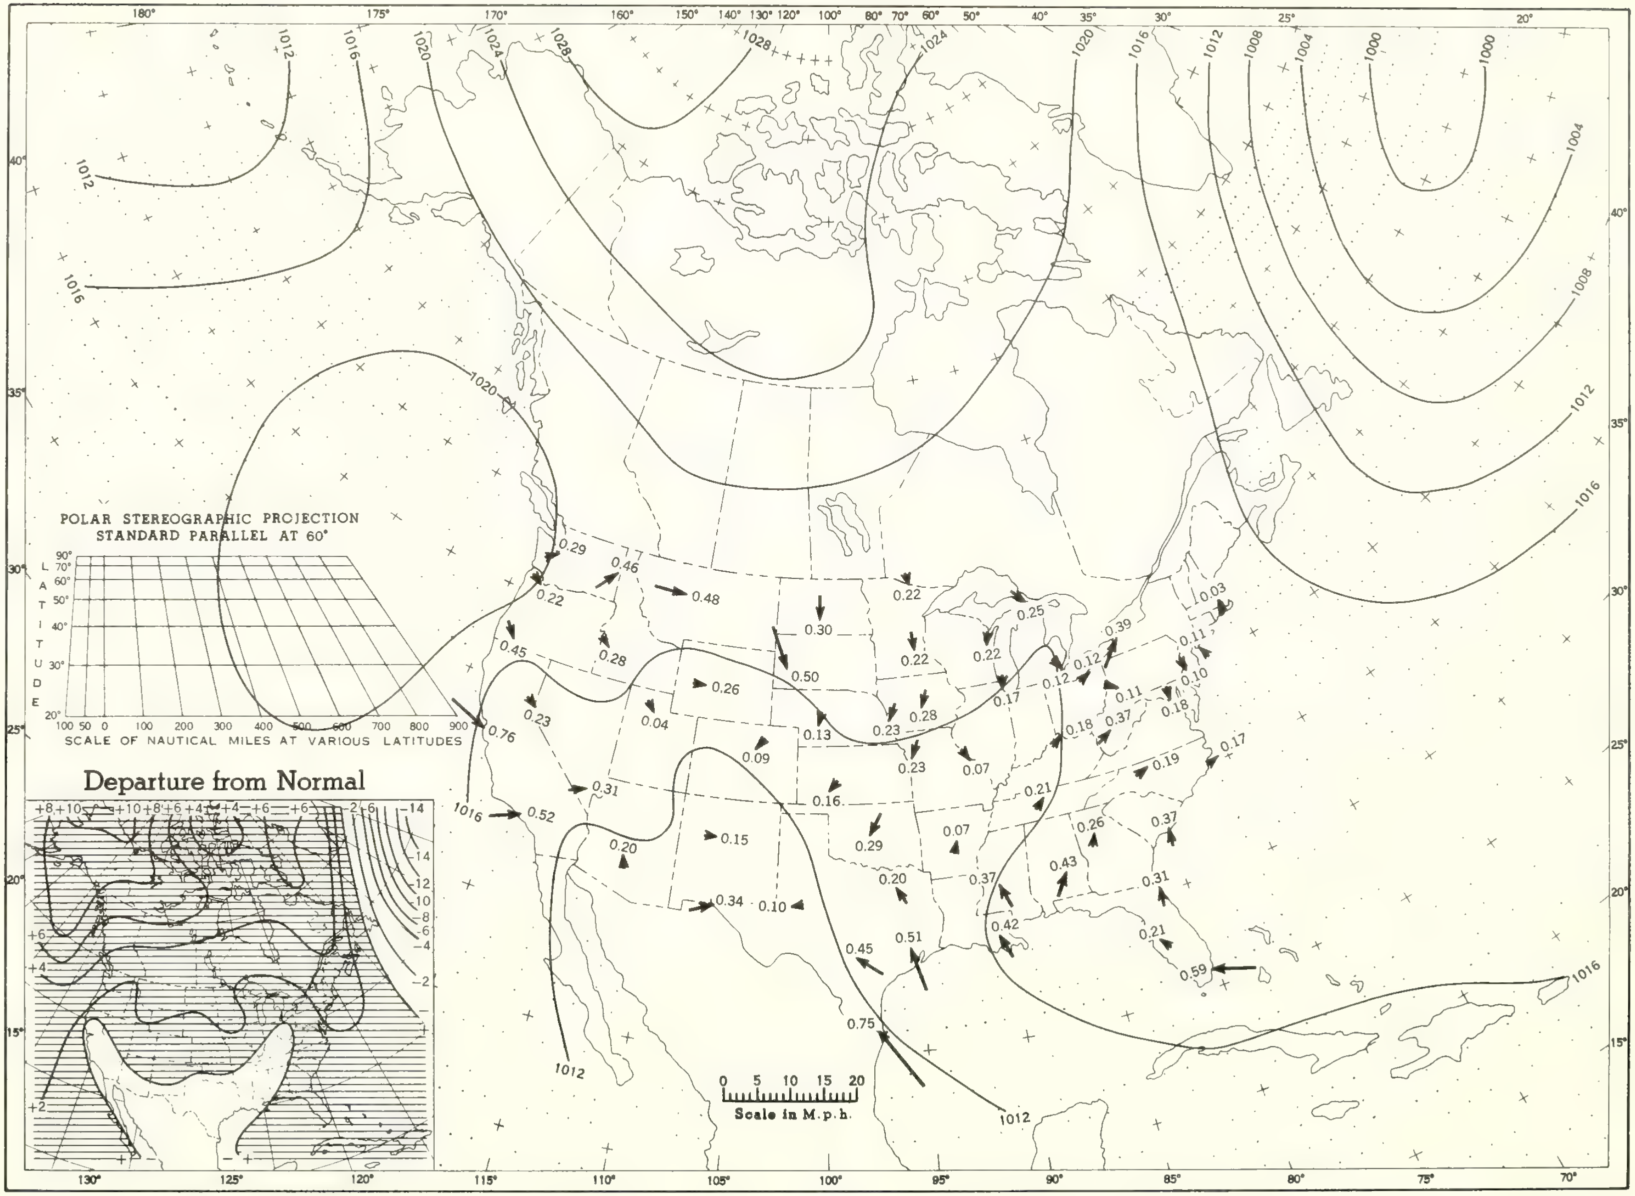
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, April 1966.



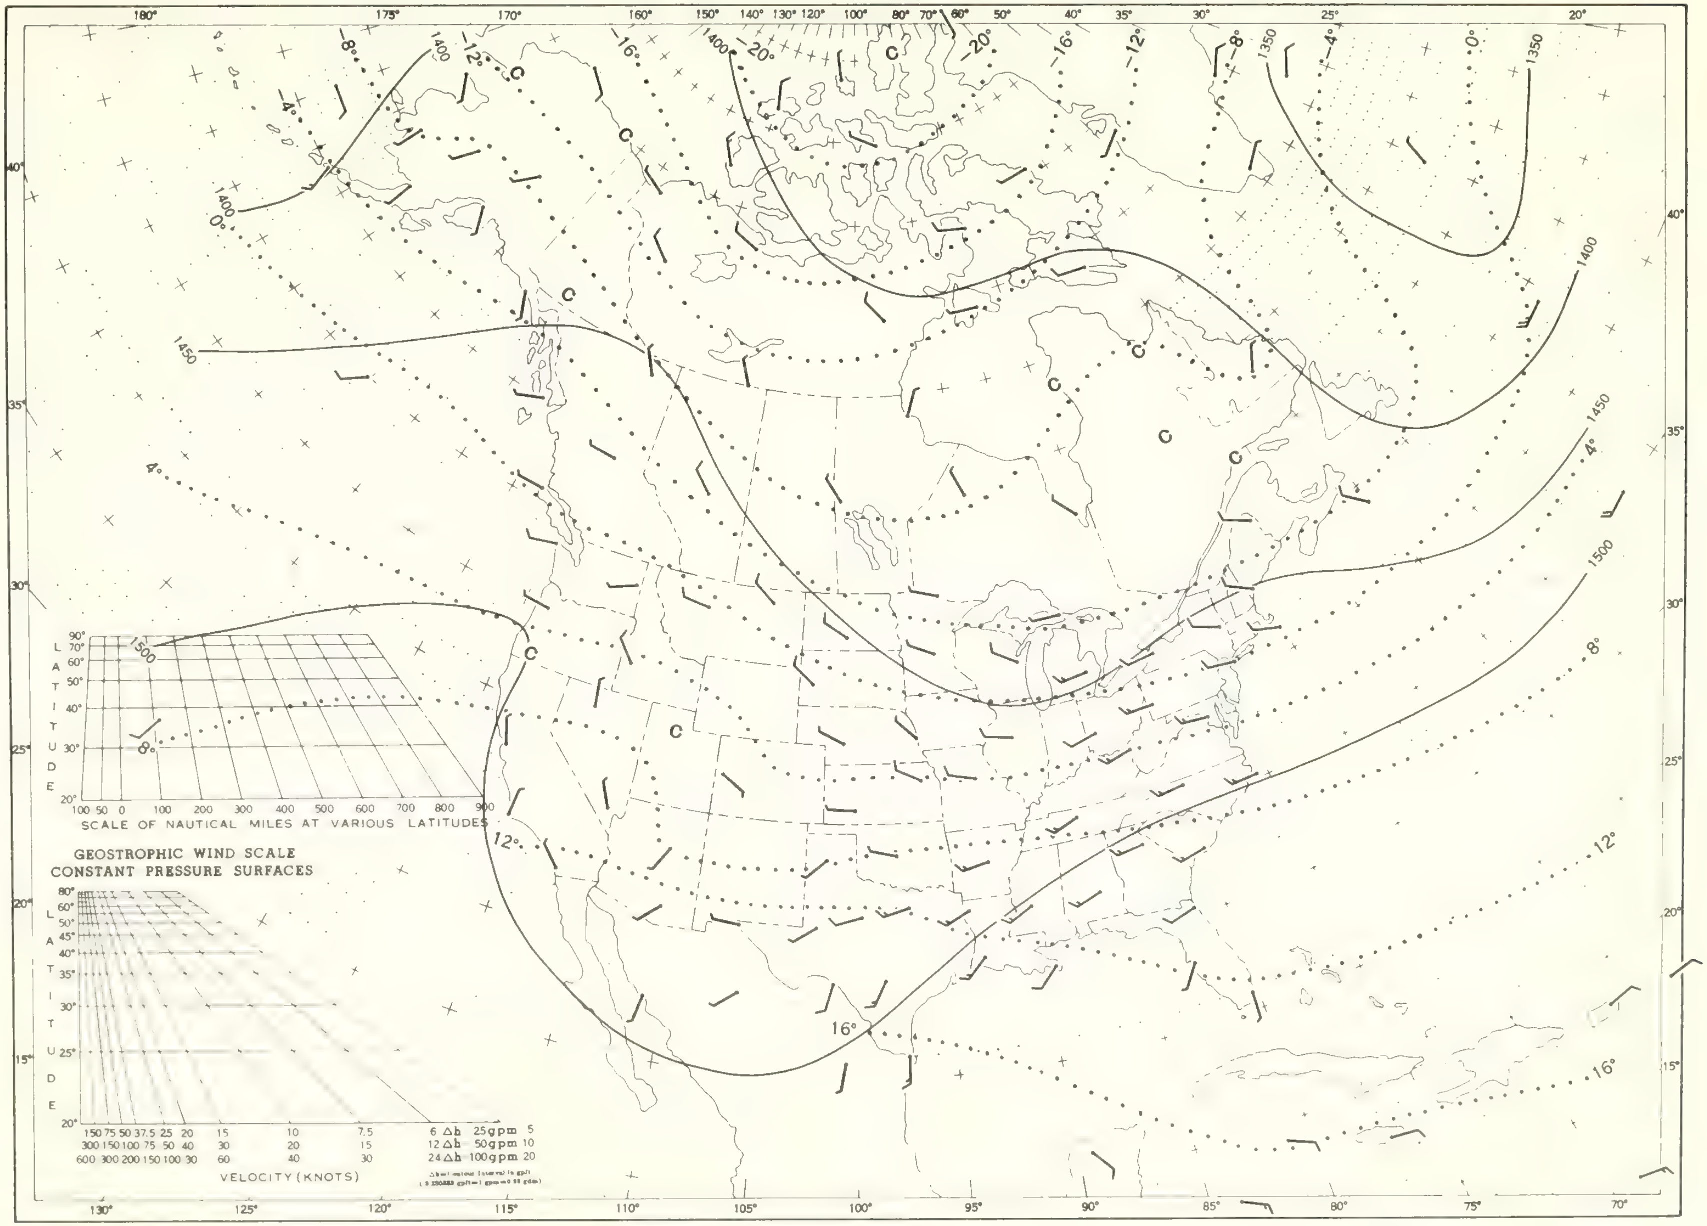
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, April 1966. Inset: Departure of Average Pressure (mb) from Normal, April 1966.



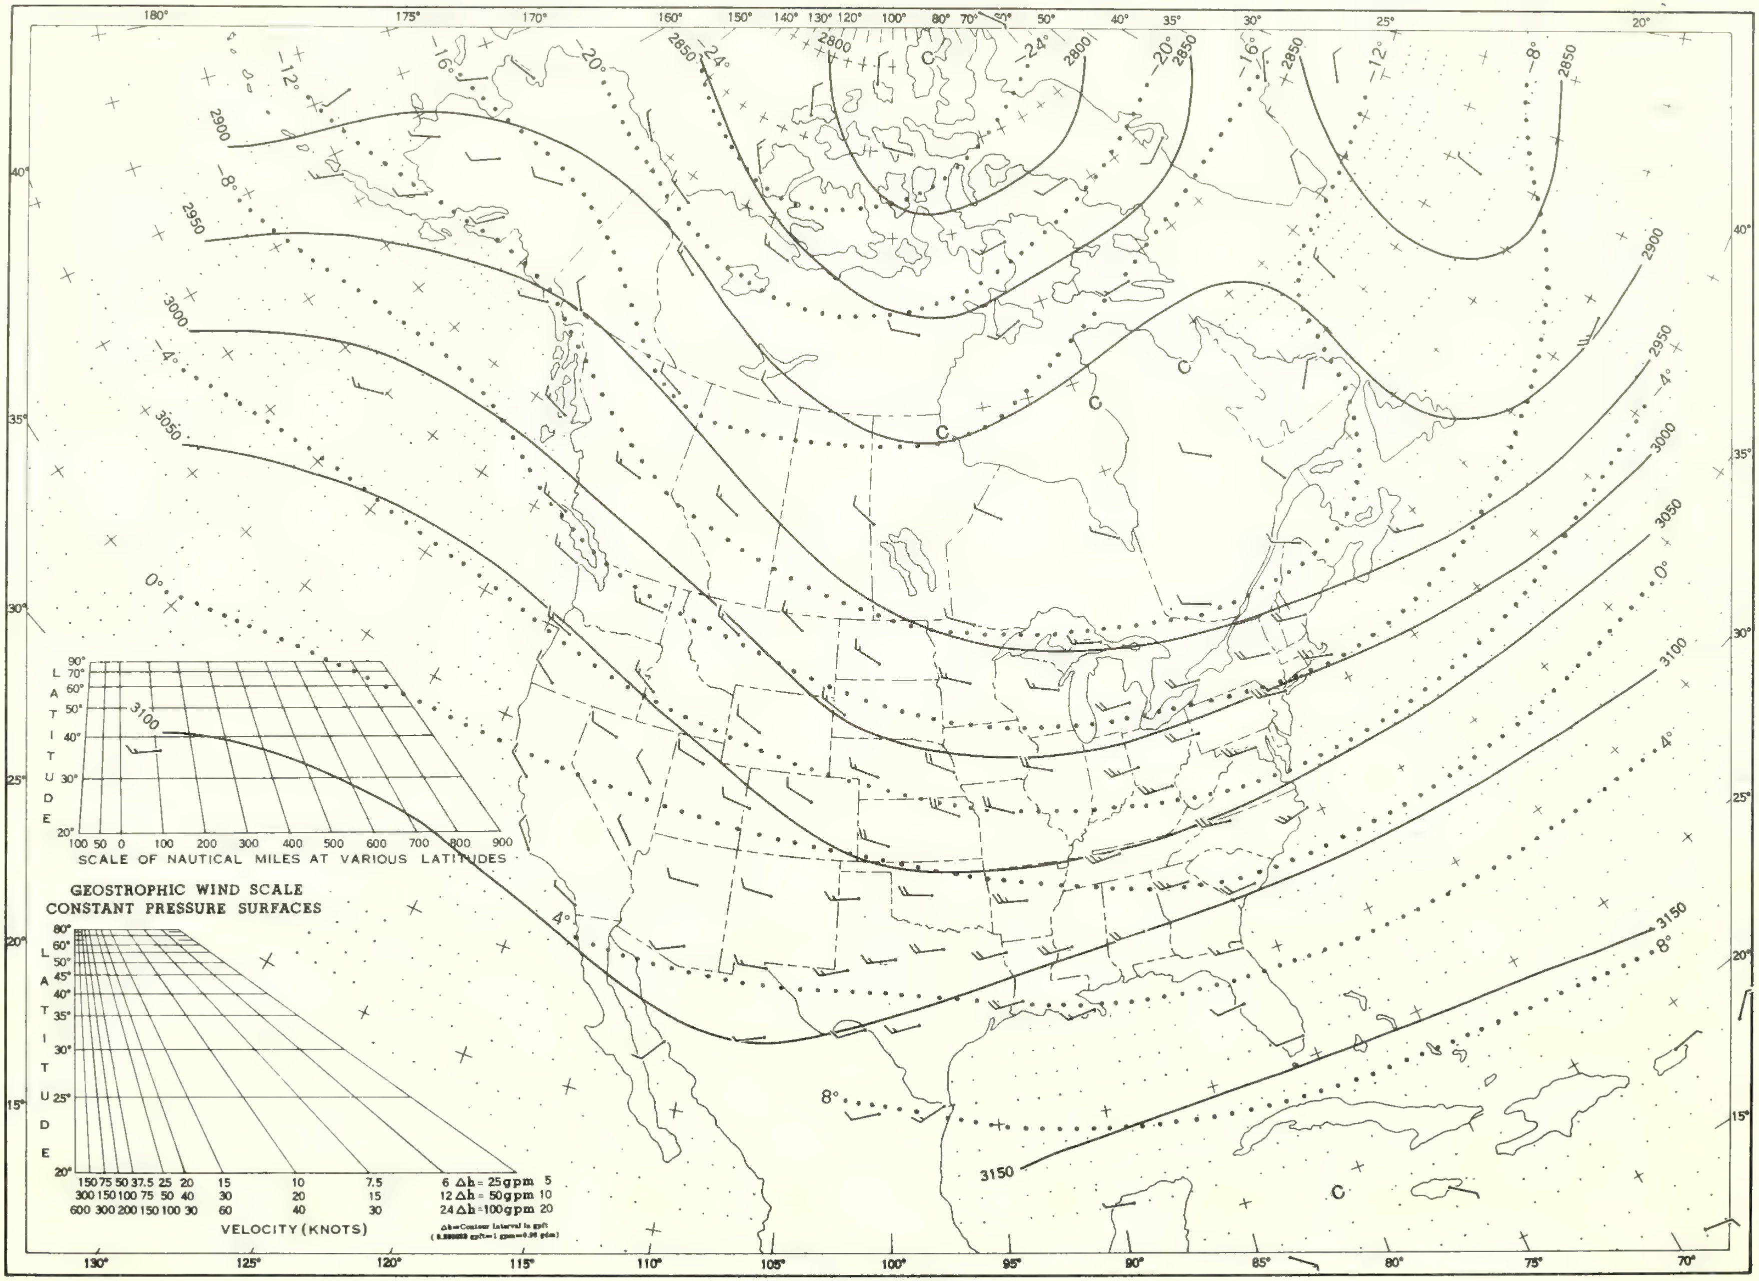
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, April 1966. Average Height and Temperature, and Resultant Winds.



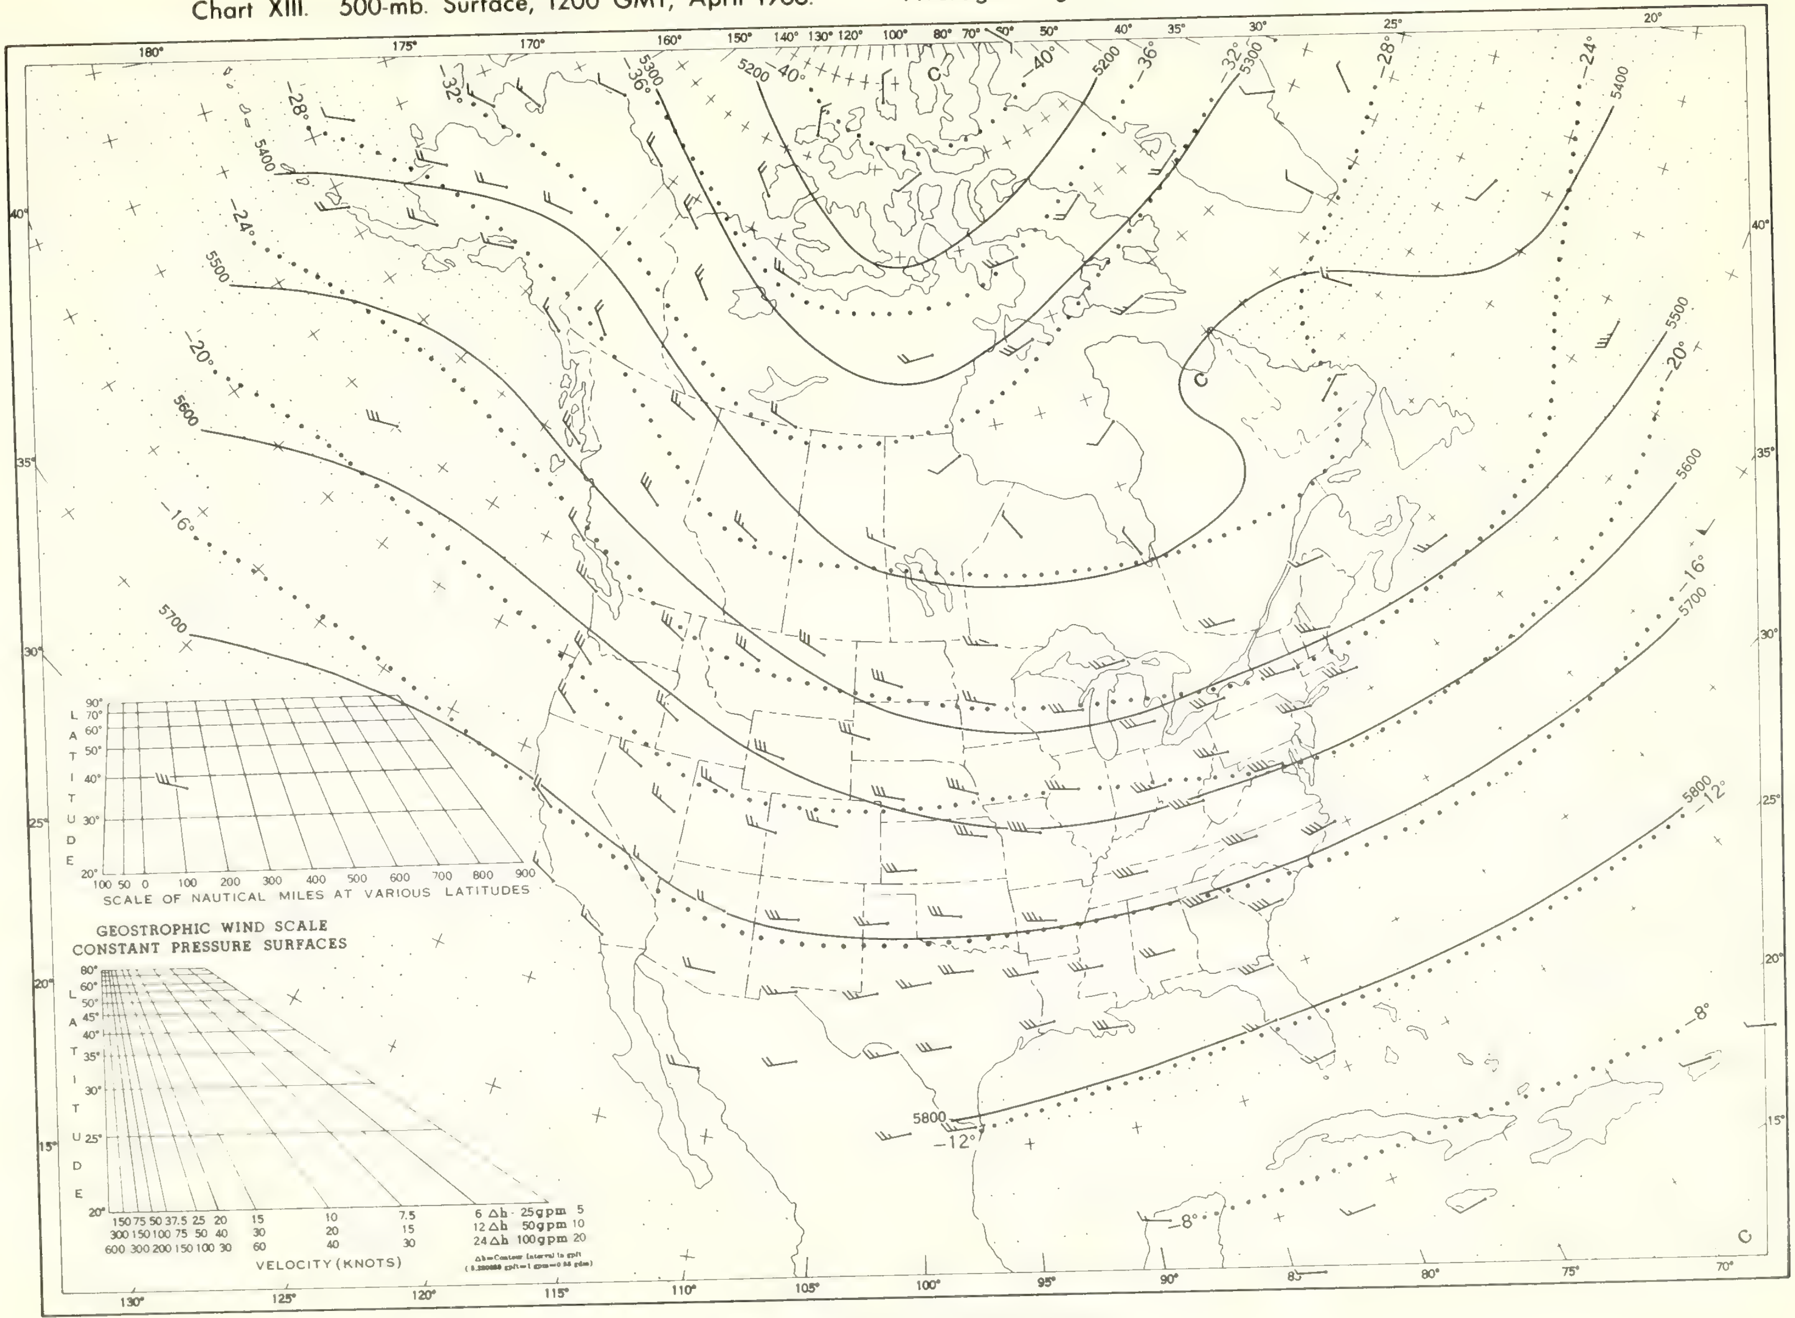
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, April 1966. Average Height and Temperature, and Resultant Winds.



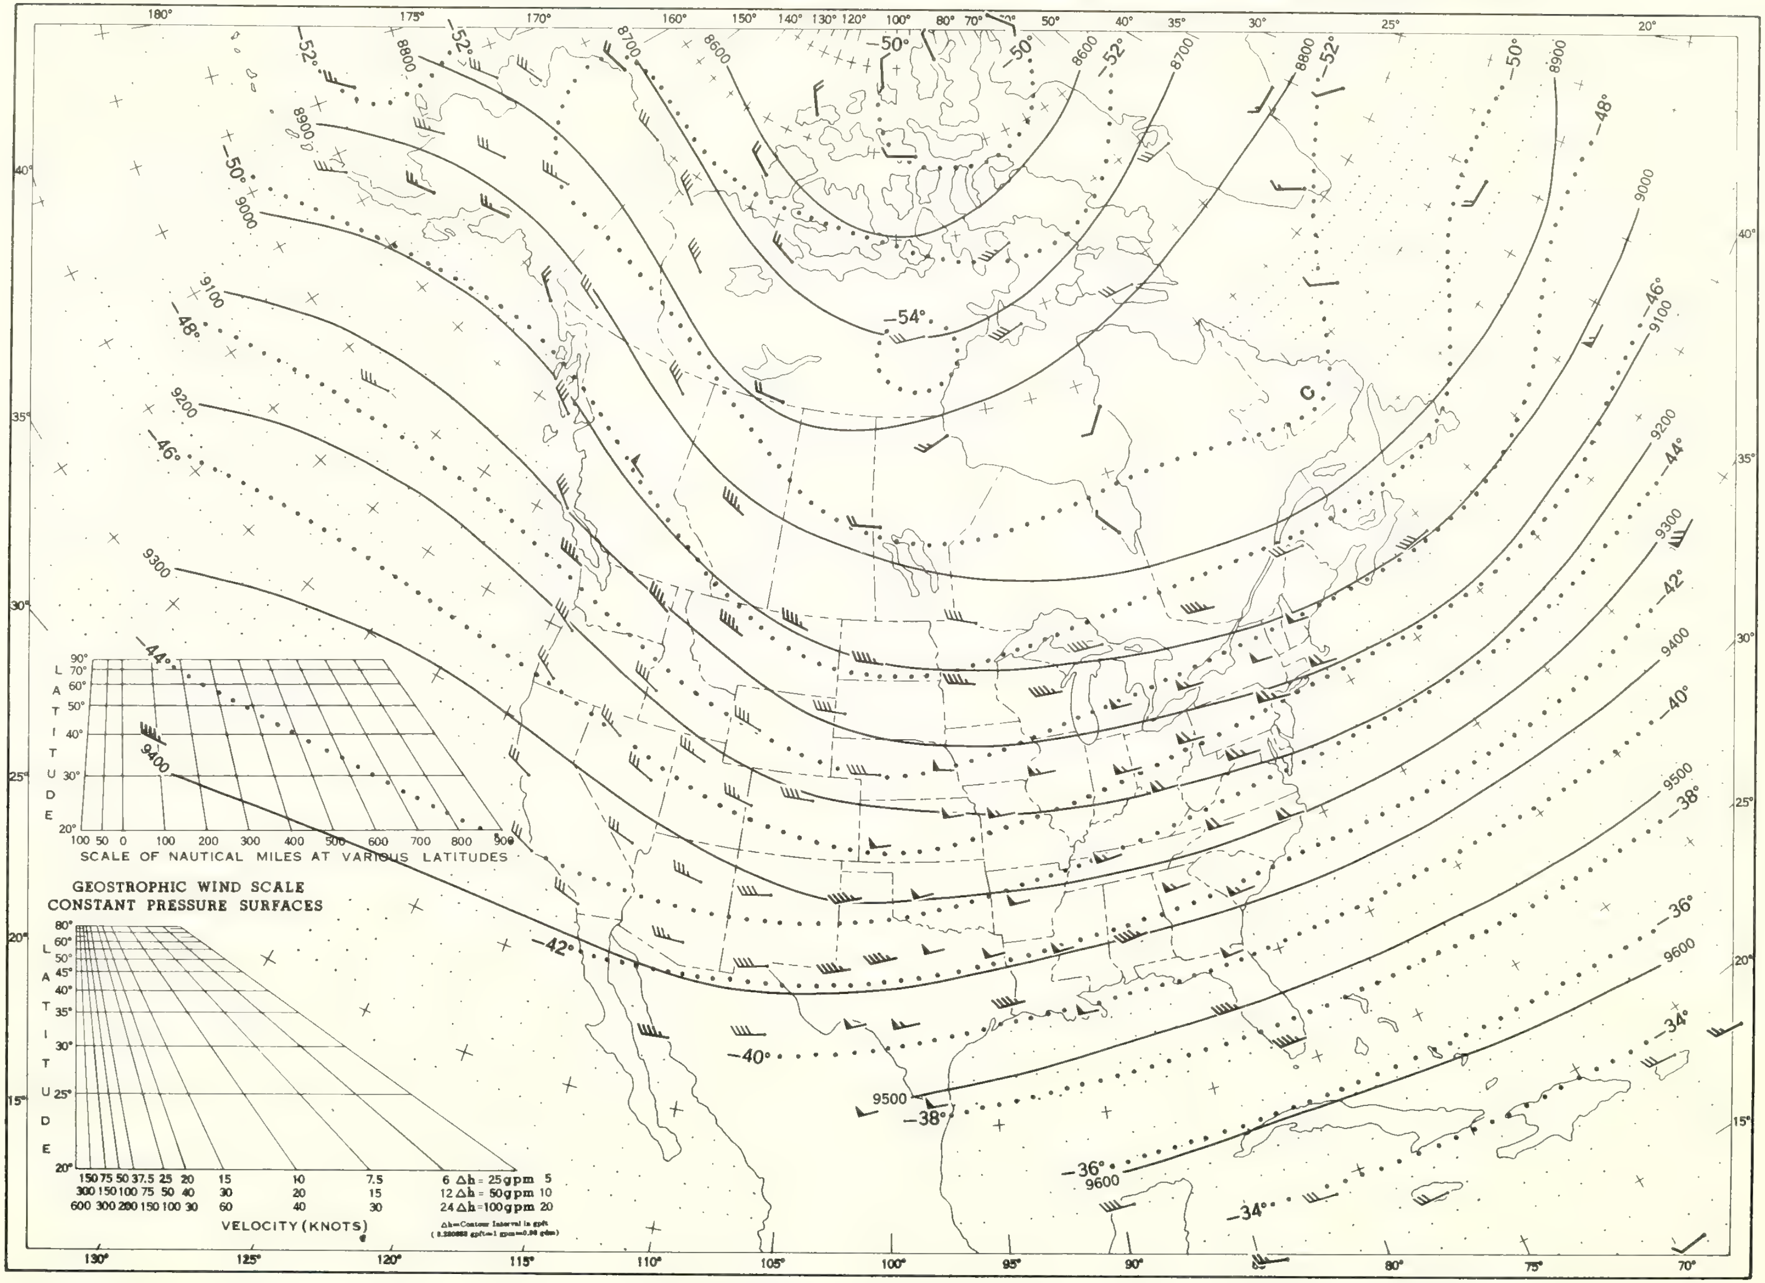
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, April 1966. Average Height and Temperature, and Resultant Winds.



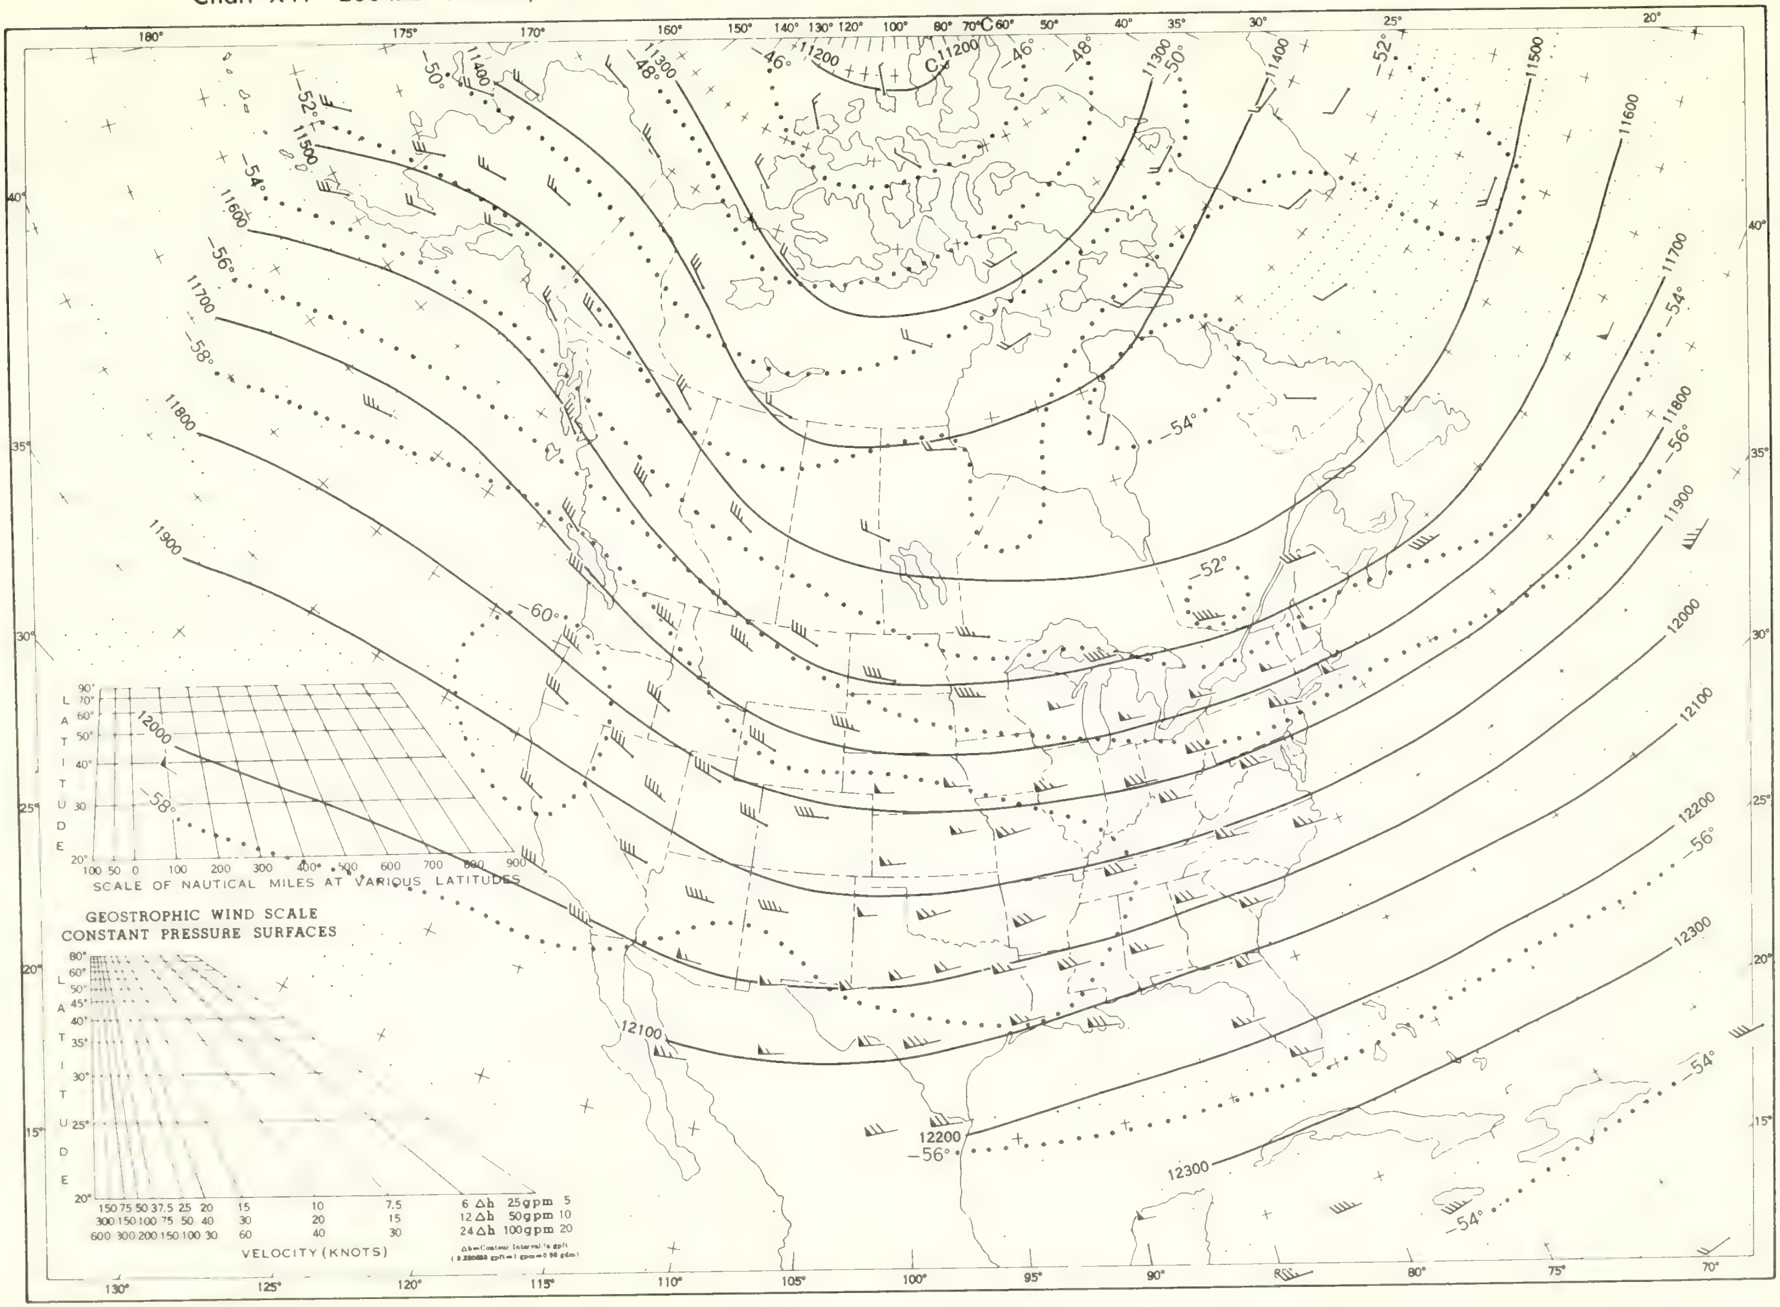
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, April 1966. Average Height and Temperature, and Resultant Winds.



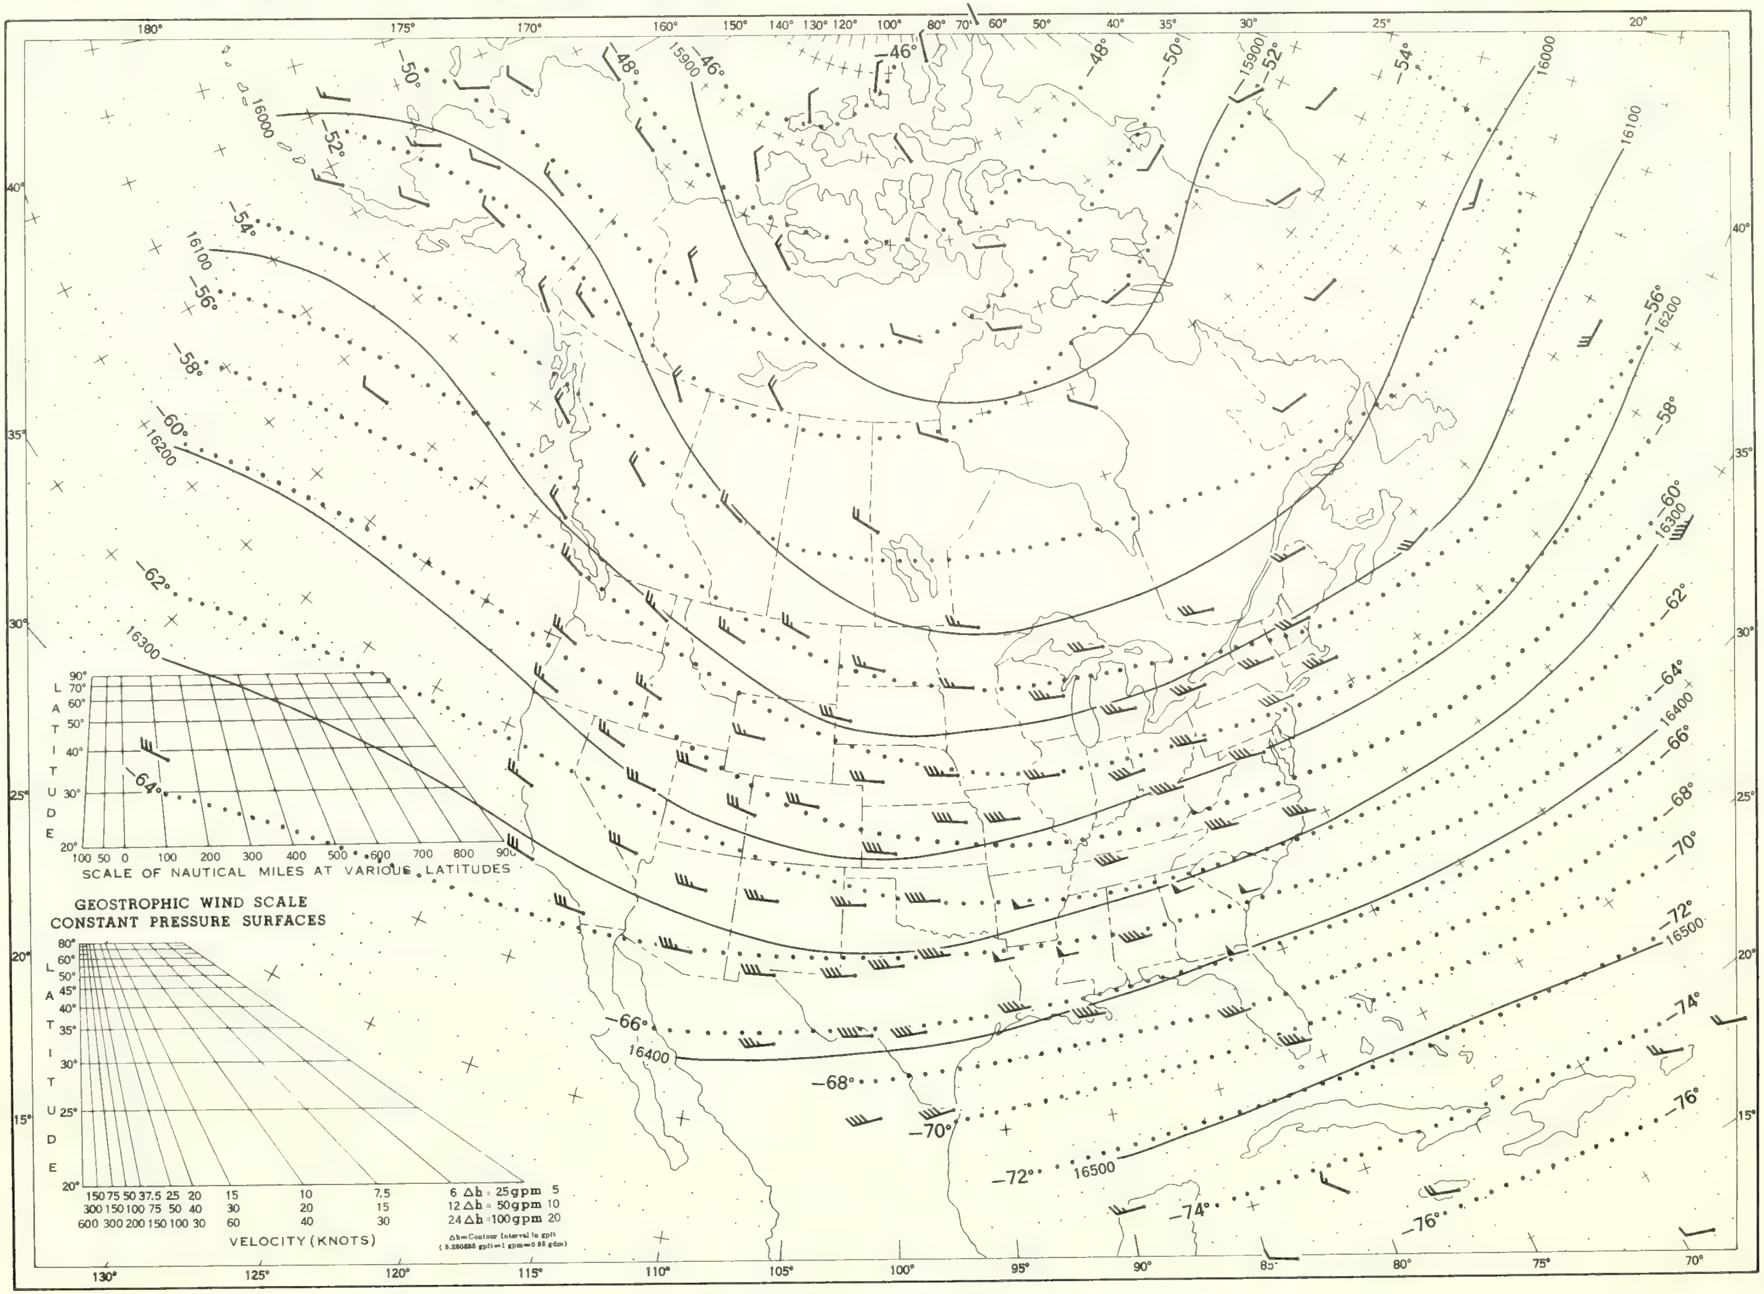
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, April 1966. Average Height and Temperature, and Resultant Winds.



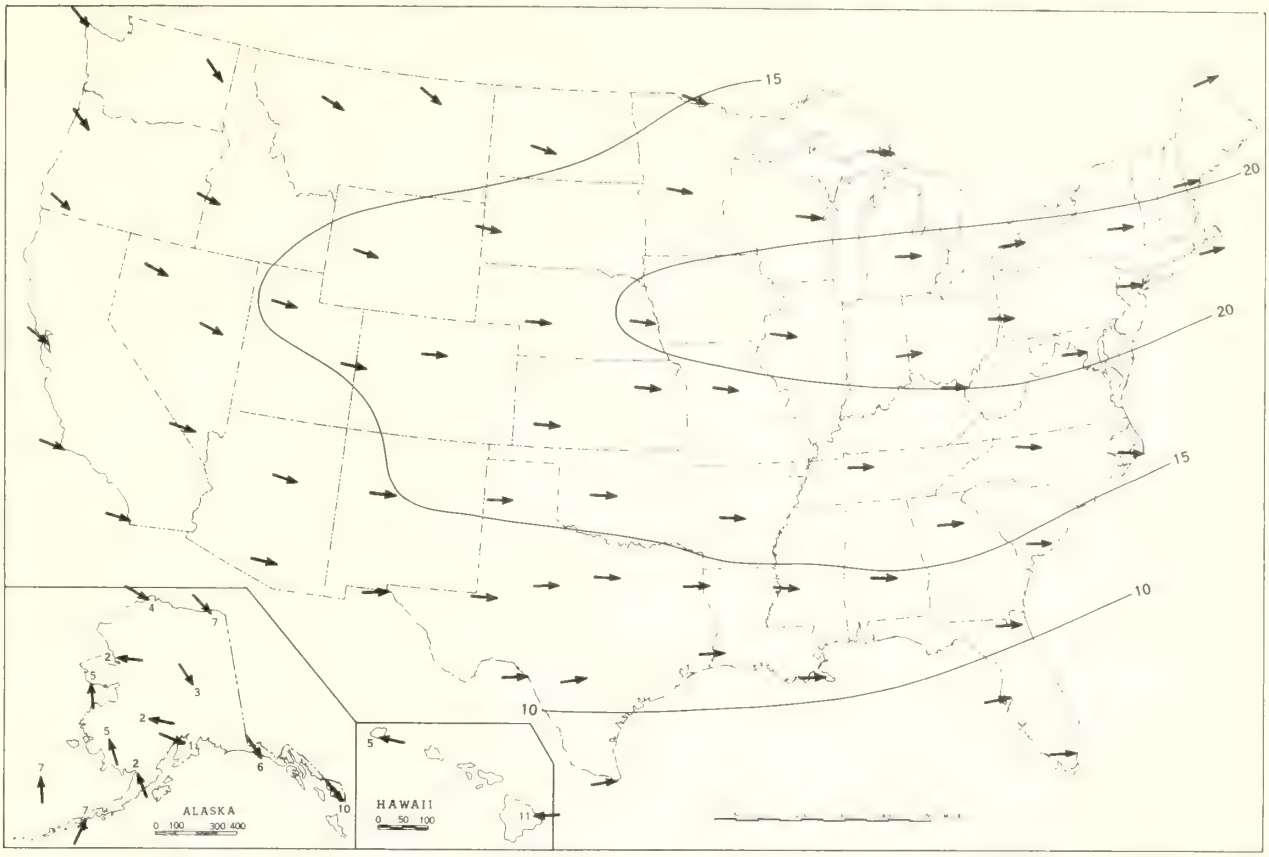
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, April 1966. Average Height and Temperature, and Resultant Winds.

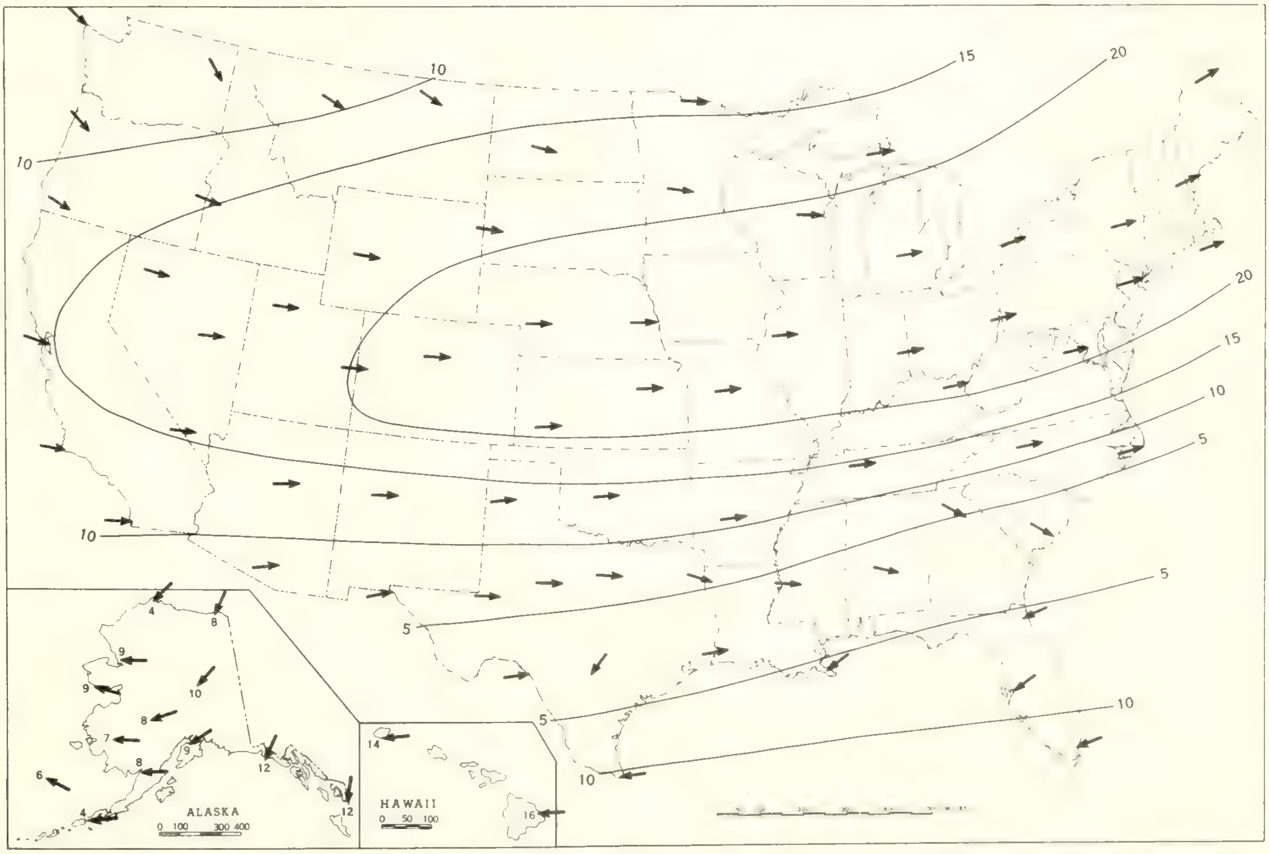


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, April 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, April 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 5 MAY 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Warm, dry, sunny weather in West.
2. Cloudy, showery, cool weather in East.
3. Record low temperatures in Midwest on May 9-10.
4. Northeast drought continued.
5. Heavy rainfall Gulf and south Atlantic coast.
6. Extremely dry in central Great Plains.

TEMPERATURE.--The month was unseasonably warm and sunny in the western half of the country, cool and cloudy in the East. Temperatures for the month averaged 6° above normal at some stations in Nevada to 6° below in parts of the Midwest. This was one of the coldest Mays on record in the northeastern quarter of the Nation where many low temperature records occurred.

The first half of the month was unusually cold in the northeastern quarter of the conterminous United States where temperatures averaged 6° to 9° below normal for the first week. The freeze line dipped down into the Ohio Valley, and on the 7th Sault Ste. Marie, Mich., recorded 18°, the lowest ever there for May.

During the second week an unusually cold and extensive area of high pressure overspread all areas from the Rocky Mountain States eastward. Temperatures for the week averaged below normal nearly everywhere, and ranged from 9° to 15° below in the northeastern quarter. Lowest temperatures generally occurred on the 10th, 11th, or 12th when temperatures fell below zero at some high stations in Colorado and on Mount Washington, N. H., and freezing occurred in all the 48 States except Arkansas, Louisiana, Mississippi, and Florida. Many stations in an area extending from the upper Mississippi Valley to the Atlantic Coast recorded their lowest temperatures ever for May. Among the stations with new May lows were Philadelphia, Pa., 28° on the 11th; Lexington, Ky., 26°; St. Louis, Mo., 31°; Milwaukee, Wis., 21°; Detroit, Mich., 25°; Cleveland, Ohio, 25°; and Indianapolis, Ind., 28°; all on the 10th. This freeze damaged fruit from North Carolina and Tennessee northward with heaviest losses in Ohio and Michigan. In the same area considerable damage to vegetables also occurred.

A hot spell occurred in the West during the first week when temperatures rose into the 80's and 90's even into the northern Rockies where Helena, Mont., reported an early season high of 86° on the 6th. The second half of the month was generally warmer than normal with abnormally cool weather in the Southeast and the Pacific Northwest the main exceptions.

A cold snap in the Northeast at the end of the month again brought near record low temperatures for so late in the month.

PRECIPITATION.--Precipitation was frequent east of the Mississippi, but monthly totals were above normal only in the Mississippi Valley and most of the Gulf and Atlantic coastal areas. In the rest of the 48 States monthly totals were nearly all below normal. Owing to the unusually cold weather, more snowfall occurred in northern areas than is usual for May.

In the South monthly totals exceeded 10 inches at points in Texas, Louisiana, Mississippi, and Georgia. The greatest total in the 48 States was 15.05 inches at Metter, Ga. Development of vegetation and fieldwork in the East was about 1 to 2 weeks late. This was the wettest May in Georgia and at Jackson, Miss., since 1923.

Below normal precipitation continued the drought in the Northeast. Precipitation in most interior sections of New England and eastern New York ranged from 50% to 75% of normal. Western New York State, much of the western two-thirds of Pennsylvania, West Virginia, western Virginia, and western Maryland had less than 25% of normal. While late winter and early spring precipitation improved drought conditions in New York and Pennsylvania, May deficits were disappointing there. Above normal rainfall in coastal areas from southern New England southward was very beneficial.

The month was also extremely dry in the upper Great Lakes region and west of the Mississippi. Most of this region received less than 50% of normal precipitation and the central Great Plains and Far Southwest less than 25%. Cheyenne, Wyo., had its driest May since 1871; Aberdeen, S. Dak., since 1895; and Denver, Colo., since 1919. This was one of the driest Mays on record in Kansas where Topeka, the capital, not only had its driest May with 0.41 inch but also its driest January-May period with 3.19 inches. Wheat was deteriorating in the western two-thirds of Kansas at the end of the month and topsoil and subsoil moisture were critically short. Small grains needed rain in Nebraska, and crops prospects were declining in eastern Colorado.

SNOW.--The water supply outlook in the West continued to deteriorate during May, it being either the second or third consecutive very dry month in most sections. In Idaho not a single storm in the last 3-month period was heavy enough to increase streamflow significantly. The mountain snowpack decreased and was below normal with few exceptions. In Utah only 4 snow courses had snow on the ground while 46 had snow on the ground at the end of May in 1965.

In contrast to the lack of snow in the West, late season snowfall east of the Rockies on the 8th and 9th was notable for the many new records set in northern interior sections. Dubuque, Iowa, measured 3.1 inches for the month and Burlington, Vt., 3.9 inches, May records for both stations. The Akron-Canton Airport in Ohio measured 3.2 inches of snowfall on the 9th, the fifth May snowfall since 1887. Youngstown, Ohio, had 4.7 inches of snow on the 9th, its first snowfall in May to exceed an inch. Wellsboro, Pa., had 4.0 inches on the 9th and other stations in Pennsylvania had lesser amounts the same day. Concord, N. H., measured 1.1 inches on the 8th, the fifth measurable May snowfall there since 1871.

STORMS.--Severe local storm frequency, which normally is higher for May than other months, apparently was less than usual in most areas. This was particularly true of tornadoes.

Several tornadoes crossed northern Florida early in the month and more than a dozen occurred in the mid-continent area, particularly in Kansas, Oklahoma, and Missouri, on the 11th. Hail, wind, and tornadoes were reported again in these three States on the night of the

15th.

There were many storms during the third week and on the 16th a tornado struck Columbus, Ga., causing several hundred thousand dollars damage and injuring 11 persons.

On the 23d tornadoes affected an 8-state area from Texas to Wisconsin. Considerable damage and some personal injuries were reported.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

°	Includes crop damage
C	Crop damage
R	Rain
L	Local flooding
F	Flooding

*	No occurrence of storms or unusual weather phenomena.
‡	Includes heavy sleet storm.
#	Freezing drizzle and freezing rain, commonly known as glaze.
∅	For breakdown of "All Others", and for detailed listing of other storms, see the U. S. Weather Bureau monthly publication STORM DATA.
†	Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

MAY 1966

Elmer R. Nelson, Office of Hydrology

The worst flooding since 1961 occurred in the White Basin in Arkansas during May. In the Red River Basin, the Ouachita River and tributaries reached their highest stages since 1958. Smackover Creek at Smackover, Ark., reached a near record stage early in May. In Texas severe flooding occurred in the Sabine and Trinity River Basins. Flash flooding occurred in Georgia on the Oconee River; in Illinois on the Aux Sable Creek; in West Virginia on the West Fork, Cheat, and Tygart Rivers.

HUDSON BAY DRAINAGE

Red River of the North Basin.--The Red Lake River at Crookston, Minn., went out of its banks again on April 29, cresting on May 1, nearly 1 foot above flood stage. This was considerably lower than the 24.34 feet crest occurring on April 3, which approached within 1.5 feet of the record 25.8 feet crest of April 1965. The Red Lake River continued receding during May and went below flood stage early the morning of May 5.

The Red River of the North at Grand Forks, N. Dak., rose above flood stage again on May 1, cresting on May 3 at a stage of 29.5 feet. This was 1.5 feet above flood stage but considerably lower than the earlier crest of 45.63 feet on April 4.

Farther downstream at Drayton, N. Dak., the Red River of the North continued above flood stage for a period of 44 days. It went above bankfull stage on March 28, cresting on April 8 at a record stage of 42.15 feet. It receded within its banks near midnight on May 10.

At Pembina, N. Dak., the main stem had receded to about 1 foot below flood stage by early morning of May 1. It was out of its banks the entire month of April. It crested April 11-12 at a near record stage of 51.3 feet. Flood stage at this point is 42 feet. (A SPECIAL REPORT WILL BE PUBLISHED ON THE RED RIVER OF THE NORTH FLOOD OF MARCH-MAY 1966 IN A LATER ISSUE OF THIS PUBLICATION.)

ST. LAWRENCE DRAINAGE

Lake Erie.--The St. Josephs River at Montpelier, Ohio, was out of its banks from the 14th to the 16th, cresting 1.3 feet above flood stage on the 15th. No damage was reported.

ATLANTIC SLOPE DRAINAGE

The flooding along the upper Neuse River in eastern North Carolina between the 2d and 6th was due to heavy rains ranging from 1 to 2-1/2 inches during the 24-hour period ending at 8 a.m. on the 3d. The Neuse was still at a relatively high stage before the beginning of the heavy rain during the latter part of April. Additional heavy rain of 1 to 2 inches over the upper Neuse during the 24-hour period ending at 8 a.m. on the 22d caused another rise to nearly 2.5 feet above bankfull stage at Smithfield, N. C. The flooding extended downstream to Goldsboro, N. C. No damage was reported from the flooding.

Minor flooding occurred on the Lumber River at Lumberton, N. C., from the 3d to the 7th. Heavy local rains from the 22d through the 27th caused additional flooding on the Lumber River beginning on the 23d and continuing into June. Minor overflow occurred on the north Fork Edisto on the 27th and 28th. Moderate flooding of about 3 feet occurred along the main Edisto at Givhans, S. C., between the 27th and June 5. Several camp sites and approach roads were inundated for several days near Givhans, S. C., on the Edisto.

Flooding occurred on the Savannah River at Clyo, Ga., from the 24th through the end of the month. Flooding occurred mainly in low swampy areas. No damage was reported. The Ogeechee River went out of its banks at Dover and Eden, Ga., on the 28th and continued in flood into June. Flooding occurred mainly in low, swampy areas subject to frequent overflow. No damage was reported.

Severe flash flooding occurred in the headwaters of the Oconee River in Georgia on the 26th and 27th. The Athens area was especially hard hit by extremely heavy rains on the night of the 26-27th. The Weather Bureau cooperative observer at Athens recorded 8.42 inches of rain during the 24-hour period ending at 8 a.m. on the 27th. Most of this rain fell in a period of 8 hours. This was the greatest 24-hour rainfall recorded at Athens during 90 years of record. The heavy rains and resulting flooding of small streams caused extensive damage to streets, roads, bridges, yards, and some buildings in and around Athens. One man lost his life when he drove his car into a stream where a bridge had been washed out. Minor overflow occurred on the Oconee at Milledgeville, Ga., on the 28th, 30th, and 31st. Heavy rains in southern Georgia, totaling 13.60 inches at Folkston, caused the Satilla River to go above bankfull stage on the 27th, cresting more than 2 feet above flood stage on the 31st.

EAST GULF OF MEXICO DRAINAGE

Frequent heavy rains of 1 inch or more during the last half of the month caused the Apalachicola River at Blountstown, Fla., to go above flood stage on the 19th. It crested nearly 2.5 feet above flood stage on the 25th and continued in flood until the 29th. It went above flood stage again on the 31st. Little or no damage resulted in the flooded areas which are heavily wooded and unpopulated. The high water slowed down lumbering operations and interrupted fishing camp industries.

Minor flooding occurred on the Oostanaula River on the 1st and 2d of the month due to general rains during the last 5 days of April. These rains caused the Coosa River at Gadsden, Ala., to go out of its banks on April 28 and continue in flood all of May. These rains were sufficient to fill the reservoir above recently completed Lock 3. Damage was in the form of inundation to farm- and pasturelands. Minor damage resulted to public roads and railroads.

Heavy rains during the last 10 days of April in Mississippi and Alabama caused flooding in the Tombigbee and Pearl River Basins during the latter part of April and the first half of May. Flooding along tributary streams was of short duration and was over by May 3. Flooding along the main stem of the Tombigbee was in progress from the 1st to the 9th. Flooding continued along the Pearl from April 23 to May 16. The crests ranged from 2.4 feet above flood stage at Pearl River, La., to 11 feet above at Jackson, Miss. The Pearl River continued to fall until well below flood stage when a 2-inch rainfall on the 12th and 13th over the headwaters caused the river to start rising again. A heavy thunderstorm on the 18th deposited over 4 inches of rain over Jackson, Miss., and the area immediate to the north. Additional rain of 3 inches followed over a 5-day period causing the Pearl to go out of its banks again at Jackson and Monticello, Miss., between the 20th and 28th. At Pearl River, La., the river went above flood stage on the 25th and continued in flood through the end of the month.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Flooding occurred over the lower Des Moines, the Skunk, and lower Iowa Rivers in Iowa due to heavy rain around the middle of the month. Flooding was confined to low-lying agricultural lands which are normally subjected to flooding during the spring months. The planting of low-lying bottom lands was delayed. No additional damage was reported.

Heavy thunderstorms on the 11th and 12th caused flash flooding at several locations in the Illinois Basin. At Morris, Ill., the Aux Sable Creek flooded portions of the city to depths up to 3 to 4 feet. This was due primarily to debris damming up against a narrow bridge causing the water to be diverted into the city. Flooding developed along the main stem of the Illinois from Morris to Peoria, Ill., and on the Big Muddy at Murphysboro, Ill., between the 12th and 14th. Crests ranged up to 7 feet above flood stage at Morris and LaSalle, Ill. The Fox River at Dayton, Ill., was out of its banks from the 11th to the 14th, cresting on the 12th at 4.7 feet above flood stage. A general period of showers and thundershowers over Illinois and Missouri from the 15th to the 17th caused flooding on the Kaskaskia, Big Muddy, Sangamon, and the Illinois River below Peoria, Ill. Additional heavy rainfall throughout Illinois on the 23d extended the period of flooding on the Illinois River into June in the reach at and below Chillicothe, Ill.

The main stem of the Mississippi River in the reach from Libby, Minn., to Fort Ripley, Minn., was in flood and falling slowly on May 1. It continued in flood at Atkin and Fort Ripley, Minn., until the 9th and at Libby, Minn., until the 24th.

Seven hundred miles further downstream, the Mississippi in the reach from Louisiana, Mo., to Grafton, Ill., was out of its banks between the 18th and 21st.

Missouri Basin.--The James River in South Dakota in the reach from Columbia to Ashton was out of its banks on May 1 due to snowmelt in late March and early April. The James receded below flood stage at Ashton on the 1st and continued to fall slowly the remainder of the month. Some shallow overflow continued above Ashton through May. The main loss from the flooding was agricultural. As much as 40,000 acres of land was flooded during the peak of the flood.

Moderate rains on the 10th through the 12th followed by light to moderate rains on the 15th and 16th caused the Chariton River at Chariton, Iowa, to rise over 1 foot above its banks on the 17th. The flooding began on the 16th and ended on the 17th. Local overflow occurred again at Chariton on the 24th from 1 1/2 to 2 inches of rain.

Ohio Basin.--Moderate to heavy rain showers on April 30 and May 1 caused flash flooding along the West Fork, Cheat, and Tygart Rivers in West Virginia. The heavier amounts (2.75 inches) occurred over the headwater areas of the Monongahela Basin. Crests ranged up to 3.2 feet above flood stage on the West Fork at Weston, W. Va. Flood damages are expected to be minor.

Rainfall totaling near 3 inches over the Little Kanawha Basin in West Virginia from April 27 to May 2 caused up to 5 feet of overflow at Glenville and Creston, W. Va., on May 1. Preliminary estimates by Corps of Engineers indicate about $23,000 damage.

Minor flooding occurred along the lower Scioto River at Piketon, Ohio, in the beginning of the month. The overflow was due to persistent rains during the last 10 days of April. No damage was reported.

The Green River at Calhoun, Ky., was out of its banks from the 2d to the 8th due to persistent rains from April 23 through May 2. No damage was reported from the overflow.

Four feet of overflow occurred on the Muscatuck River at Austin, Ind., between April 30 and May 2. Minor overflow occurred on the White River at Petersburg, Ind., on the 3d and 4th. No damage was reported from the overflow of bottom land.

The Little Wabash River at Wilcox, Ill., and the Saline River at Harrisburg, Ill., which went out of their banks on April 24 receded within their banks on the 2d and 3d respectively. Additional rains of 1.5 inches on the 12th and 13th caused a very slight overflow on the Saline on the 12th and 13th. Rains averaging 1.5 to 2 inches on the 18th caused additional minor overflow on the Skillet Fork, Little Wabash, and Saline Rivers. No damage, other than delaying spring work, was reported from the overflows.

Minor overflow occurred along the main stem of the Ohio River at Point Pleasant, W. Va., and in the lower reach at and below Leavenworth, Ind., between the 1st and 14th. This flooding was due to general heavy rains from April 23 through May 2. These heavy rains produced record rainfall totals for the month of April for Louisville, Ky., and some other portions of the Ohio Basin. The monthly April total of 9.56 inches at Louisville was the greatest in April records dating back to 1872. Streamflow progressively increased throughout the latter part of April to above flood stage on May 1-8. The flow at Louisville was sufficient to produce considerable driftwood and current, cancelling the paddle wheel steamboat race scheduled as part of the Kentucky Derby festival. The overflow necessitated the evacuation from a few summer homes. There was slight damage to early botton-land plantings and minor disruption of business.

White Basin.--Flooding in the White Basin during May was mainly due to rains which occurred during the last 2 weeks of April and May 1. These rains produced the worst flooding in the White Basin in Arkansas since 1961. The Black River at Black Rock, Ark., went above flood stage on April 23 and continued in flood through May. The crest on April 25 was nearly 11 feet above flood stage. Further upstream at Pocahontas, Ark., the Black went out of its banks on April 24 and continued in flood until May 5. It crested on April 28, nearly 5 feet above flood stage. The Cache River at Patterson, Ark., went above bankfull stage on April 21 and continued in flood into June. The main stem of the White began overflowing at Batesville, Ark., on April 24. The entire White River was out of its banks by May 2. It crested between April 24 and May 9 up to 4.3 feet above flood stage. Additional light to heavy rains during May on the 12th, 16th, 18th, and 24th caused minor rises on the already flooded Black and Cache Rivers. These rains lengthened the period of overflow by about 2 weeks. Preliminary estimates of damage from the overflows total nearly $2 million.

Red Basin.--Severe flooding occurred on the Ouachita and tributaries in Arkansas from moderate rains beginning on April 21. The heaviest rains occurred on April 24, 26, 29, 30, and May 1. The Ouachita and tributaries reached their highest stages since 1958. Smackover Creek at Smackover, Ark., (below Camden), approached within 0.3 foot of the record stage on the morning of May 2. Rains on April 30 and May 1 totaled 5 to 6 inches in 24 hours. The Ouachita receded rapidly after May 5 and fell below flood stage at Camden on May 11. Ouachita County and surrounding counties were declared disaster areas. The Little Missouri at Boughton, Ark., and the Little River at Horatio, Ark., topped their banks by nearly 2 feet on May 2.

Seven to 9 inches of rain on April 22-26 and 4 to 5 inches on April 29-30 caused flooding on the Sulphur and Cypress Rivers in Texas and on the lower Red River in Louisiana. The Sulphur River at Hagansport, Tex., was out of its banks from April 24 to May 8, and at Naples, Tex., from April 25 into June. The crests ranged from 11 to over 14 feet above flood stage. The Cypress River at Jefferson, Tex., was in flood from April 25 to May 16. It crested on May 1, 4.2 feet above bankfull stage.

Lower Mississippi Basin.--The St. Francis River at Fisk, Mo., and St. Francis, Ark., rose above flood stage on April 22-24 and continued in flood to May 14 and 19 respectively. The crest at Fisk of 24.8 feet on April 30 and the one at St. Francis, Ark., of 21.8 feet on May 1-3 were 0.2 foot below the March 1964 flood. About 100,000 acres of farmland in the Fisk-St. Francis area were inundated. This flooding was due to heavy rainfall on April 18, 20, 23, and 26. Heavy rains on May 23-24 caused an additional overflow at St. Francis, Ark., on May 27-30. Stages continued only a foot or less below flood stage at the end of the month from below Wappapello Dam to below St. Francis, Ark.

Heavy rain toward the end of April caused flooding on the Big Black River at Bovina, Miss., on April 26 and at Pickens, Miss., on April 29. It crested at Bovina, Miss., 6.6 feet above flood stage on April 30. It receded within its banks early in May. Moderate damage resulted from the overflow.

WEST GULF OF MEXICO DRAINAGE

Excessive rains during the last decade of April caused severe flooding in the Sabine Basin in Texas. Lake Fork Creek at Quitman, Tex., went out of its banks on April 25 and continued in flood to May 7. It crested on May 1, nearly 6 feet above flood stage. Flooding along the Sabine began on April 24 and spread downstream to Logansport, Tex., by April 28. At Milam, Tex., the river reached bankfull stage on May 3 and flood stage on May 5. By May 7 the stream was out of its banks as far downstream as Deweyville, Tex. The Sabine crested at Edgewood and Mineola, Tex., on May 1 and 2, more than 6 feet above flood stage. In the reach from Gladewater, Tex., to Logansport, Tex., a distance of 106 miles, it crested between the 3d and 7th up to 13 feet above flood stage. In the reach below, it crested between the 13th and 22d, 2 to 9 feet above flood stage. In the reach from Edgewood to Milam, Tex., the Sabine was out of its banks from 23 to 34 days, receding below flood stage at Milam on May 29. Flooding continued at Bon Wier and Deweyville, Tex., into June. Extensive lowland flooding near the river necessitated moving livestock to higher ground. Fishing camps along the river were flooded and some overflow into the yards of homes occurred. Some of the roads near the river were flooded and had to be closed.

The Angelina River near Alto, Tex., was in flood from April 26 to May 2. It crested on April 28, 2.4 feet above flood stage. The Neches River near Alto, Tex., was out of its banks from April 25 to May 18. It crested on April 30, 7.4 feet above flood stage. These overflows were due to excessive rains from April 23 to May 2.

Flooding was in progress on May 1 along the Trinity River from Dallas to Midway, Tex. The excessive rains during the last 3 days of April, falling on a basin with already wet soil and swollen streams, resulted in a total runoff comparable to the record floods of 1957 and 1908. The Trinity did not reach the high marks of those floods because of flood control structures and improved floodways in the upper portion. Heavy to excessive rains continued from April 22 to May 2 and ranged from 6 to more than 20 inches. Heavy rains followed during May on the 13th, 14th, 19th, 21st, 24th, and 25th. These recurring heavy rains produced flood conditions below Dallas most of May and into June in the reach at and below Liberty, Tex. Damage from flooding during April and May was heavy.

The only flooding on the Brazos River during May occurred in the lower portion at and below Rainbow, Tex., between the 1st and 8th. High stages occurred upstream to Waco, Tex., but did not reach flood stage.

Moderately heavy rain of 2 to 4 inches during the first week of May caused minor flooding along the Navidad and Guadalupe Rivers in Texas. There was no report of damage from these overflows.

Heavy rains on May 1 caused minor flooding on Turkey Creek from the 2d through the 5th. This water caused bankfull stages with minor flooding along the Nueces above and below Cotulla on the 8th. Heavy showers on May 19-20 caused additional minor flooding on Turkey Creek from the 22d through the 24th. Minor flooding was occurring at the beginning of the month on the middle Nueces near Tilden, Tex. Bankfull stages and minor flooding spread downstream to Three Rivers, Tex., by May 3 and to the mouth of the Nueces at Corpus Christi Bay by May 5. Augmented by runoff from the rains during first week in May minor flooding continued in the reach from Tilden to Corpus Christi Bay through May 17. At Calallen, Tex., the river continued above flood stage through the 21st. Another rise, from locally heavy showers during the night of the 19-20th caused minor flooding at Tilden, Tex., on the 22d which continued the rest of the month. Minor flooding occurred again at Calallen on the 29th. Only minor damage resulted from the overflows.

Note: All observations scheduled at 1200, G.C T Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i e , elevation angles less than 6° above the horizon, or any obstruction above the horizon

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from lithium chloride hygristors

These average values for standard pressure surfaces were obtained by rawinsondes, dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots

Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. They were also equipped with carbon hygristors These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes

+ Observations for these stations are scheduled at 0000 G. C T

R More than half of the observations are from statistical values

SOLAR RADIATION DATA

Solar radiation intensities, tabulated in langleys per minute on a surface normal to the direction of the sun.

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont.

MAY 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	358	324	344	337	355	381	351	250	353	45	73	278	265	99	325	236	230	294	271	342	303	-62	370	346	356	366	438	417	401	380	444	299

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

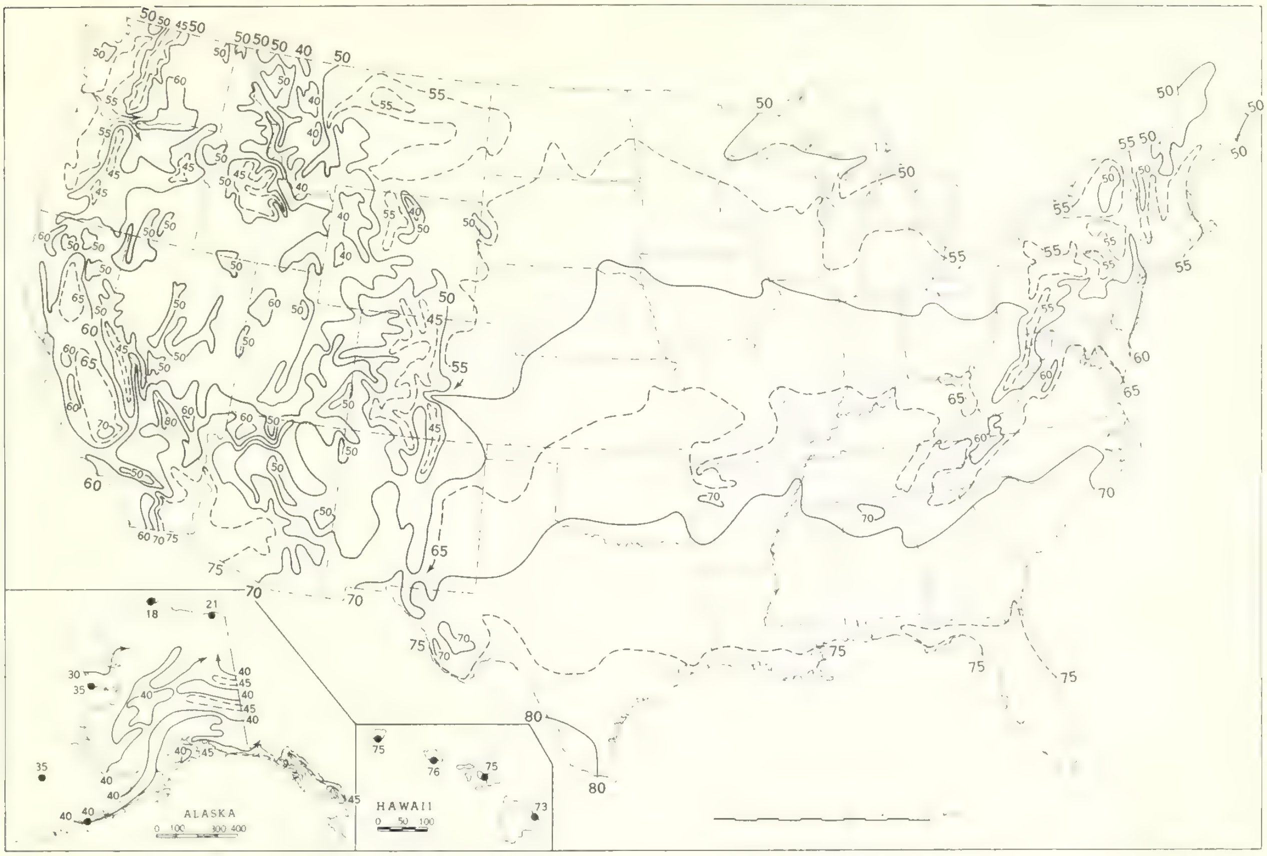
These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

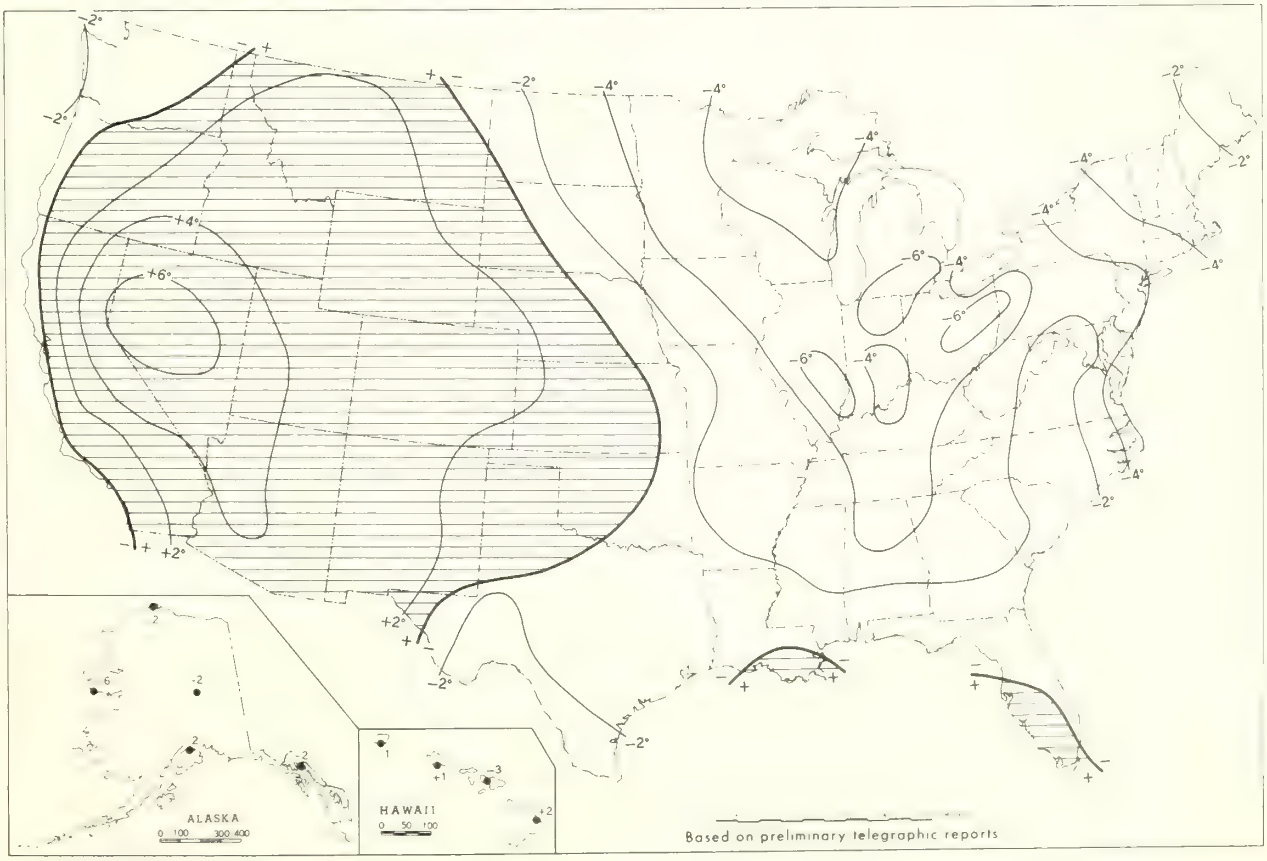
Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O_3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i e, the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e g, 350 milli-atmo-cm ozone implies an ozone layer 0 350 centimeter thick The code λ s designates the type of measurement made

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), May.

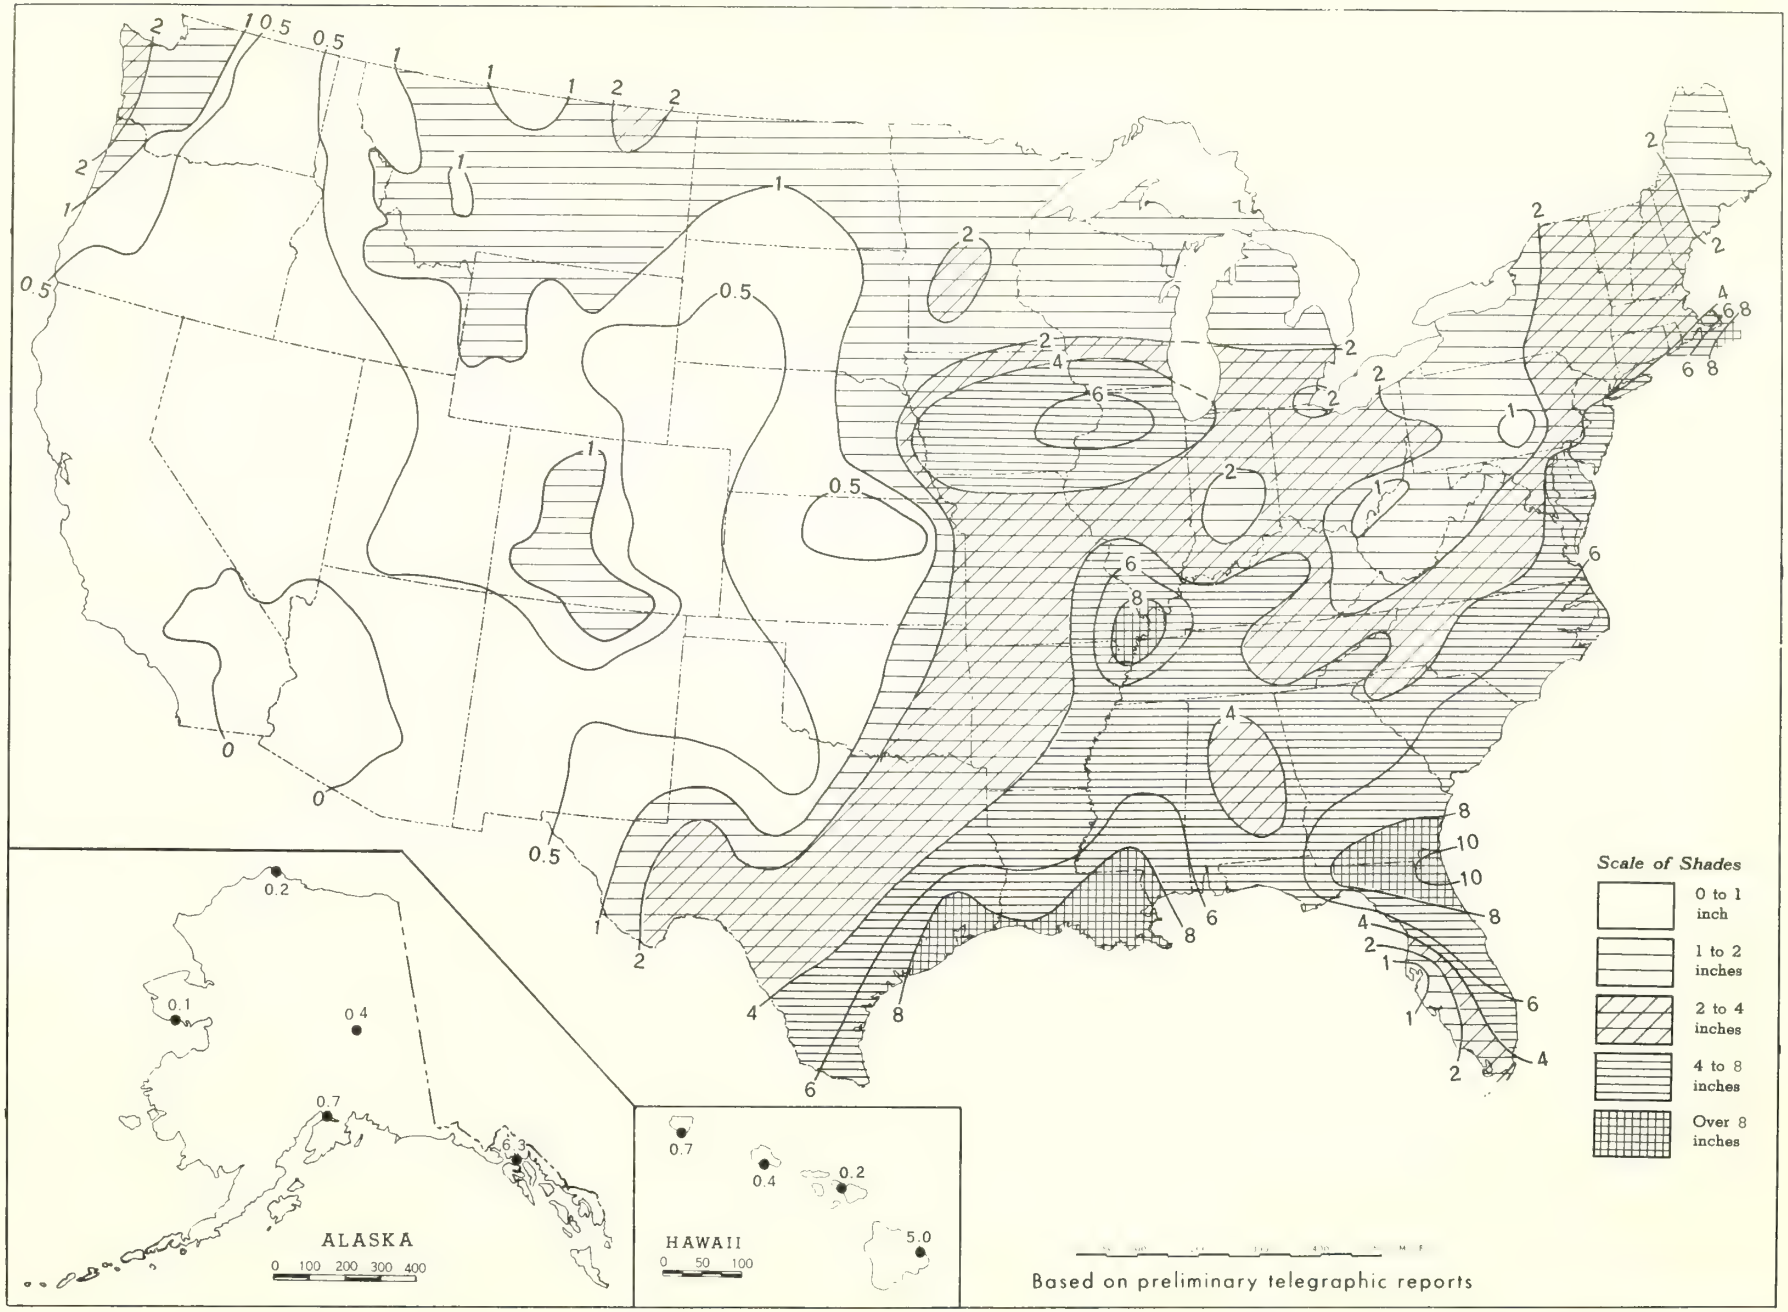


B. Temperature Departure from 30 - Year Mean (°F 1931-60), May 1966.



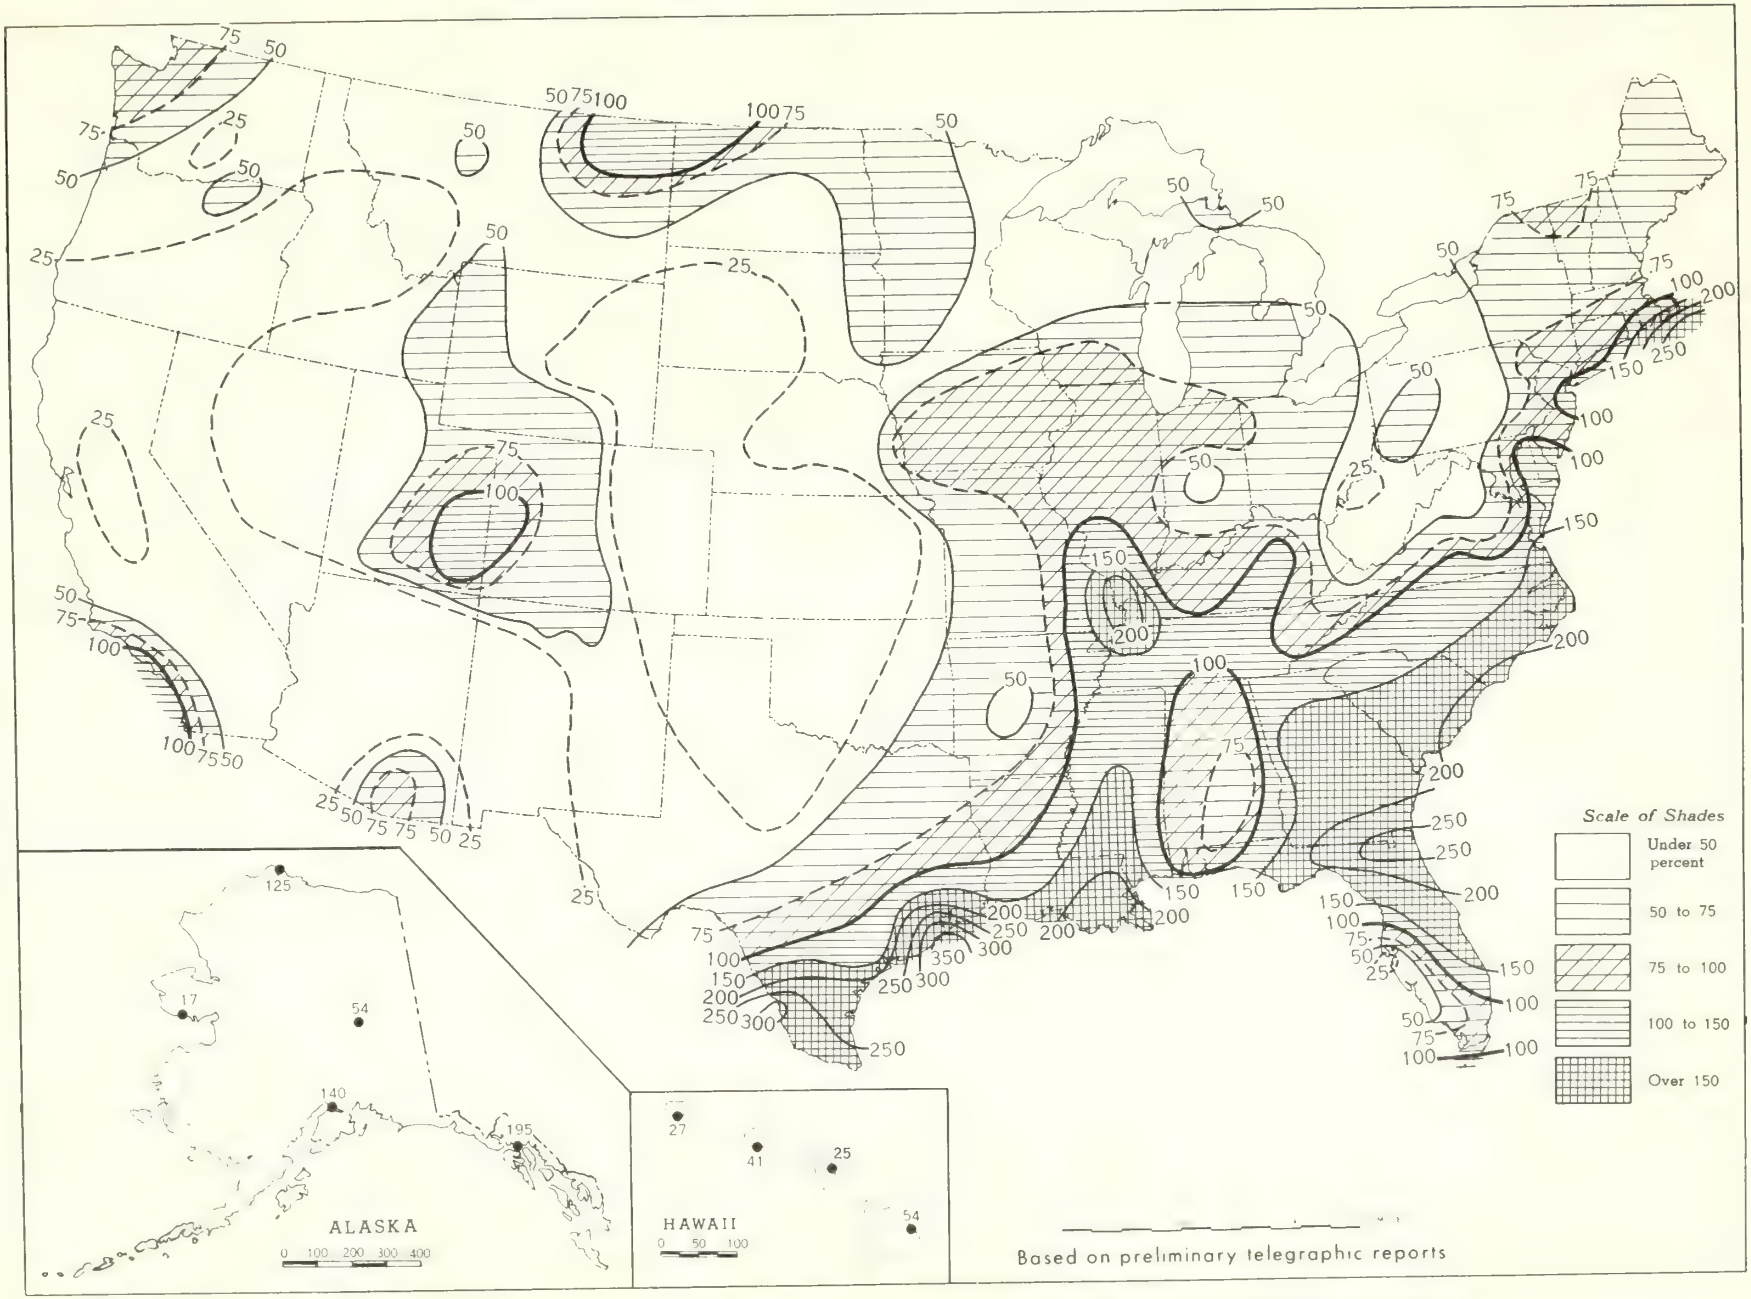
Based on preliminary telegraphic reports

Chart II. Total Precipitation (Inches), May 1966.



Based on preliminary telegraphic reports

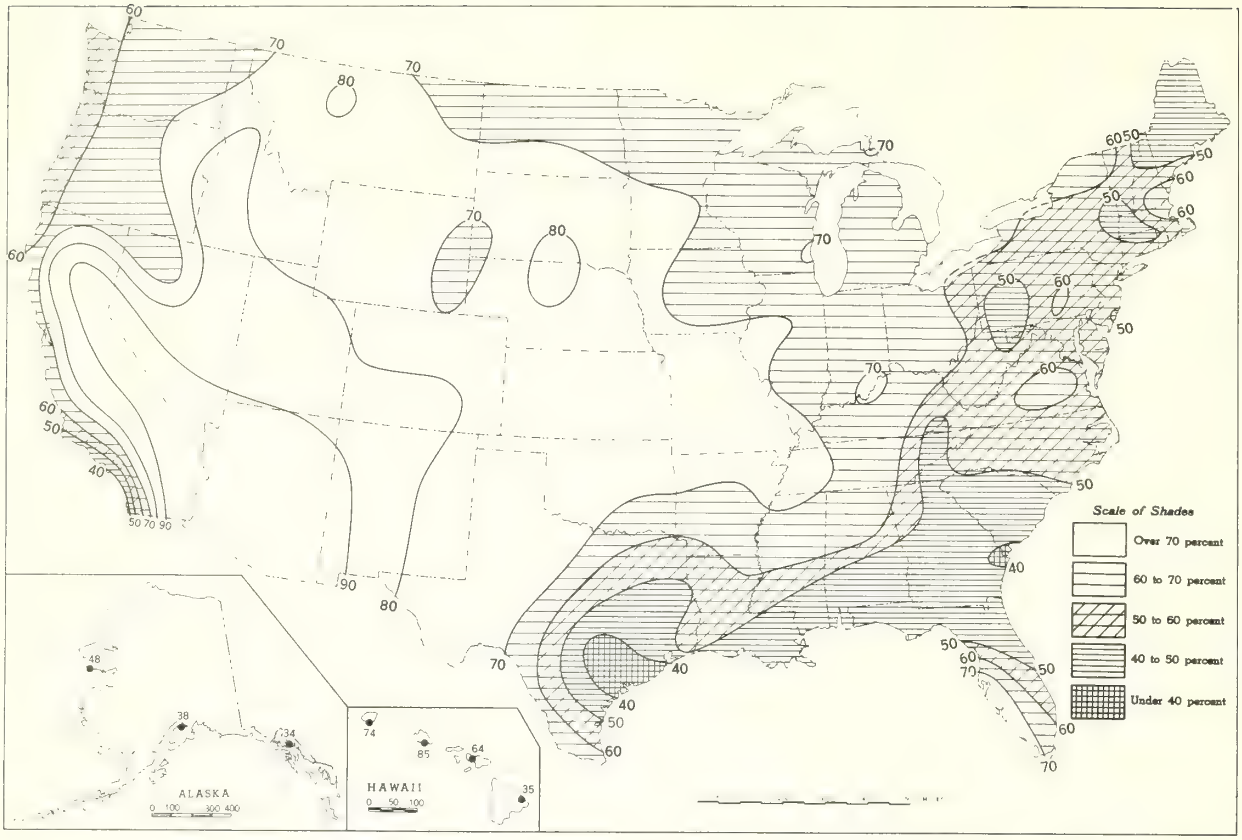
Chart III. Percentage of Normal Precipitation, May 1966.



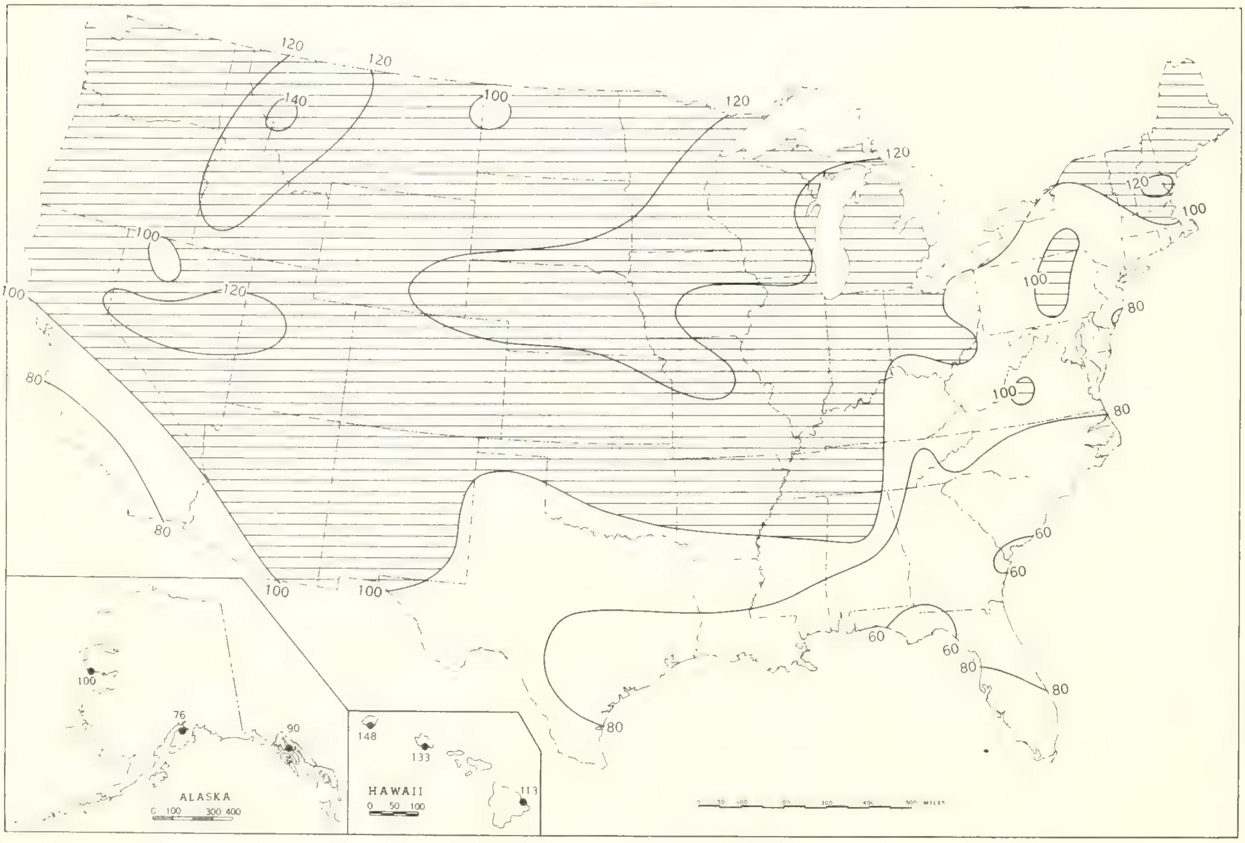
Based on preliminary telegraphic reports

Normal monthly precipitation amounts are computed from 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart VI. A. Percentage of Possible Sunshine, May 1966.

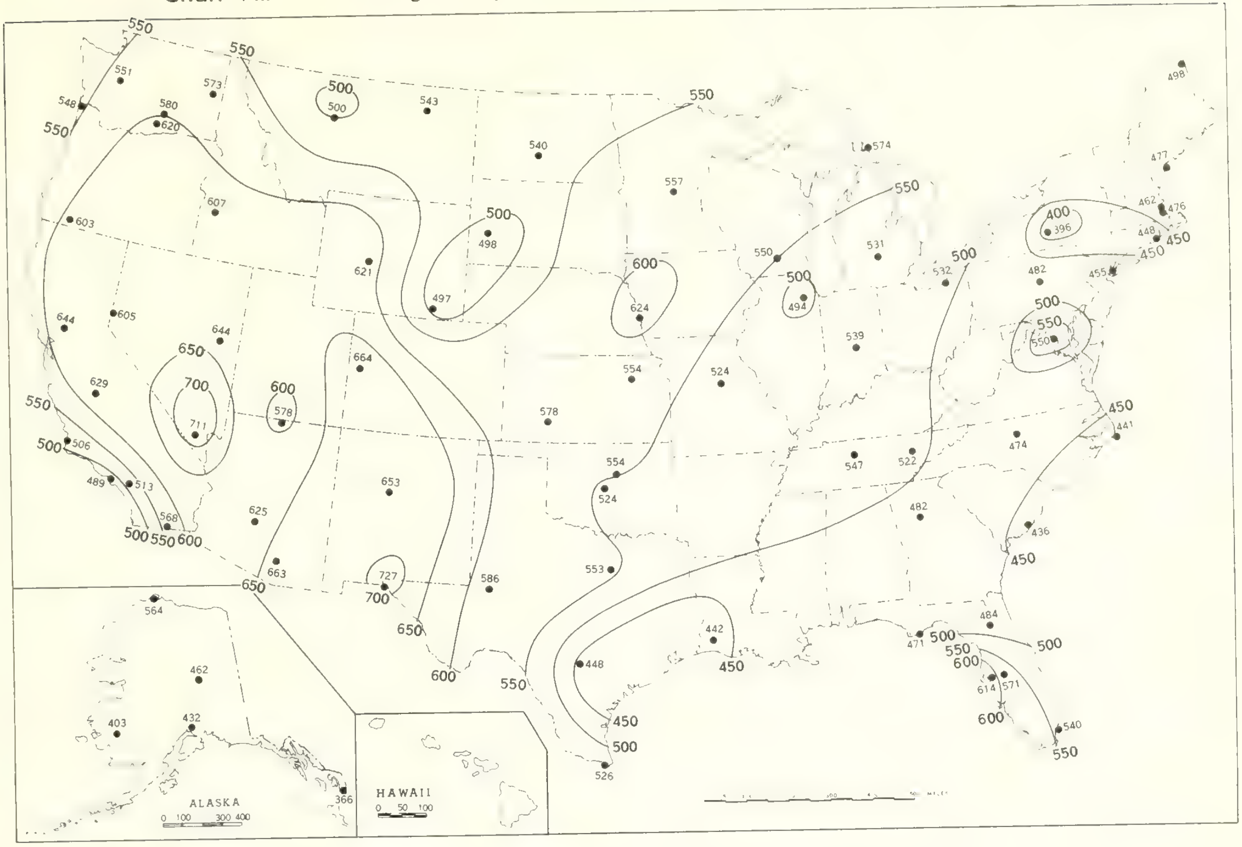


B. Percentage of Mean Monthly Sunshine, May 1966.

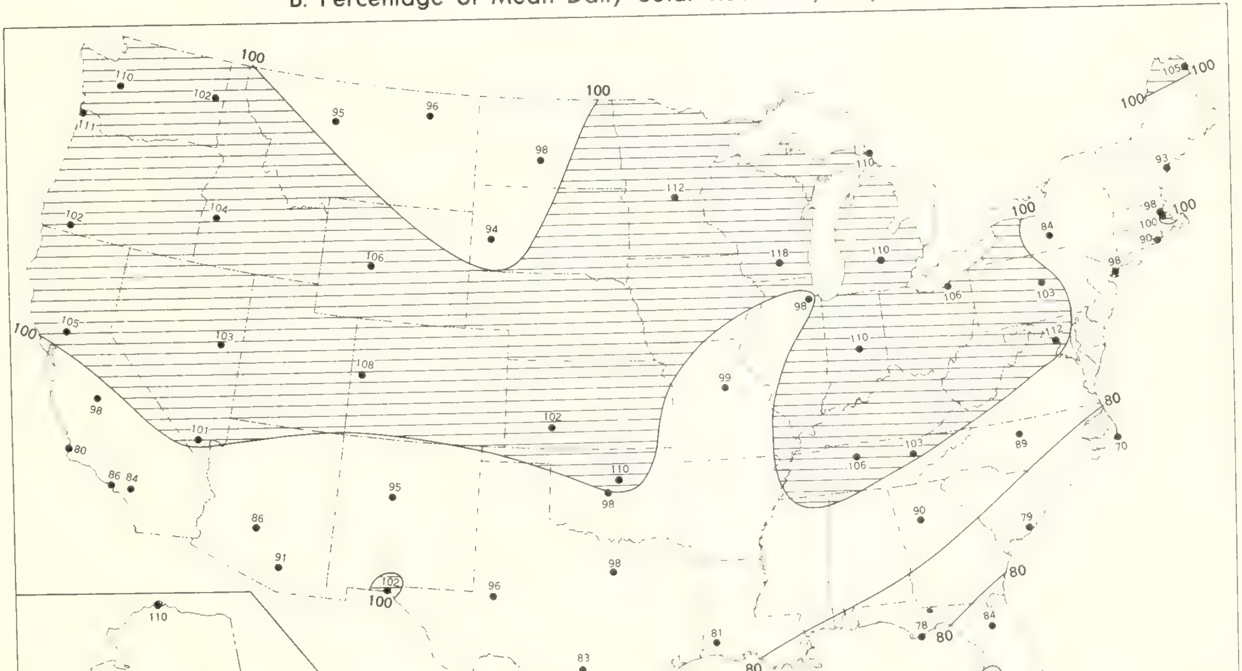


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, May 1966.

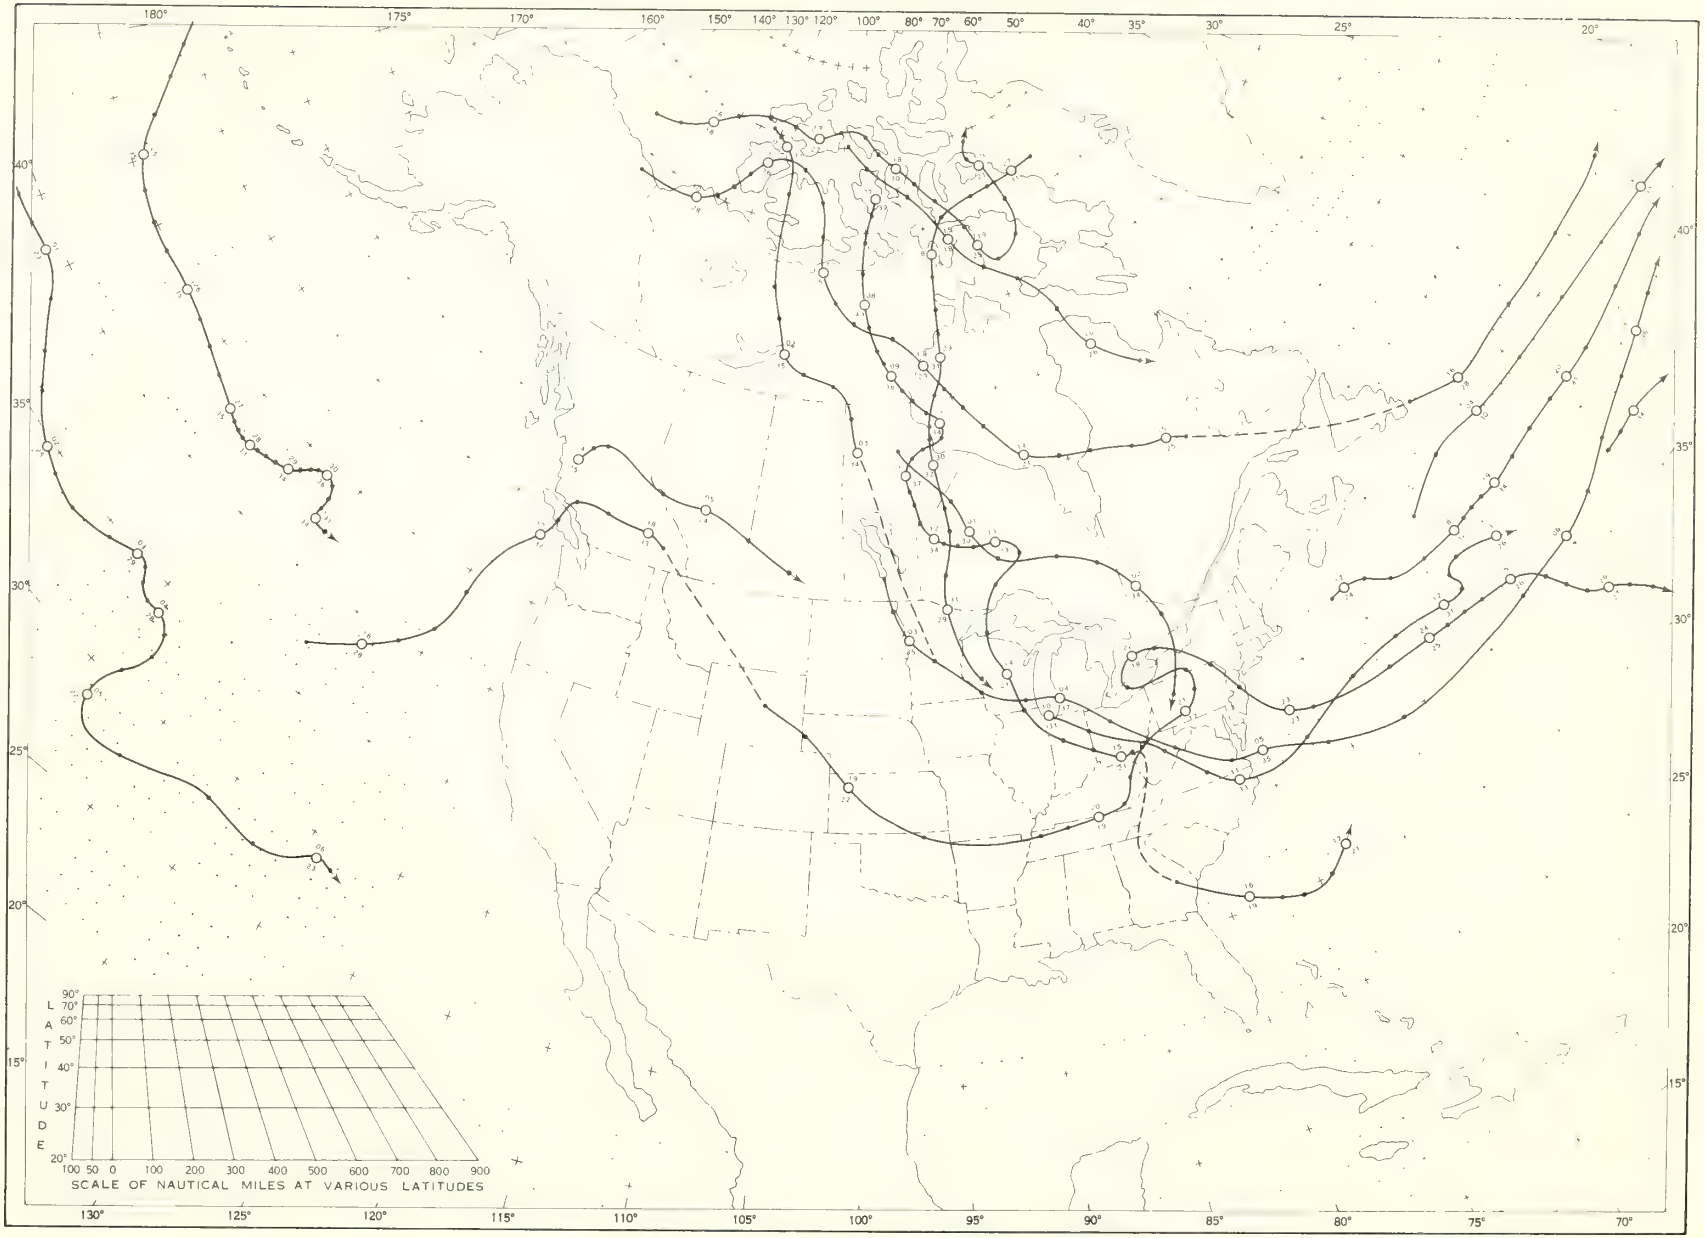


B. Percentage of Mean Daily Solar Radiation, May 1966.



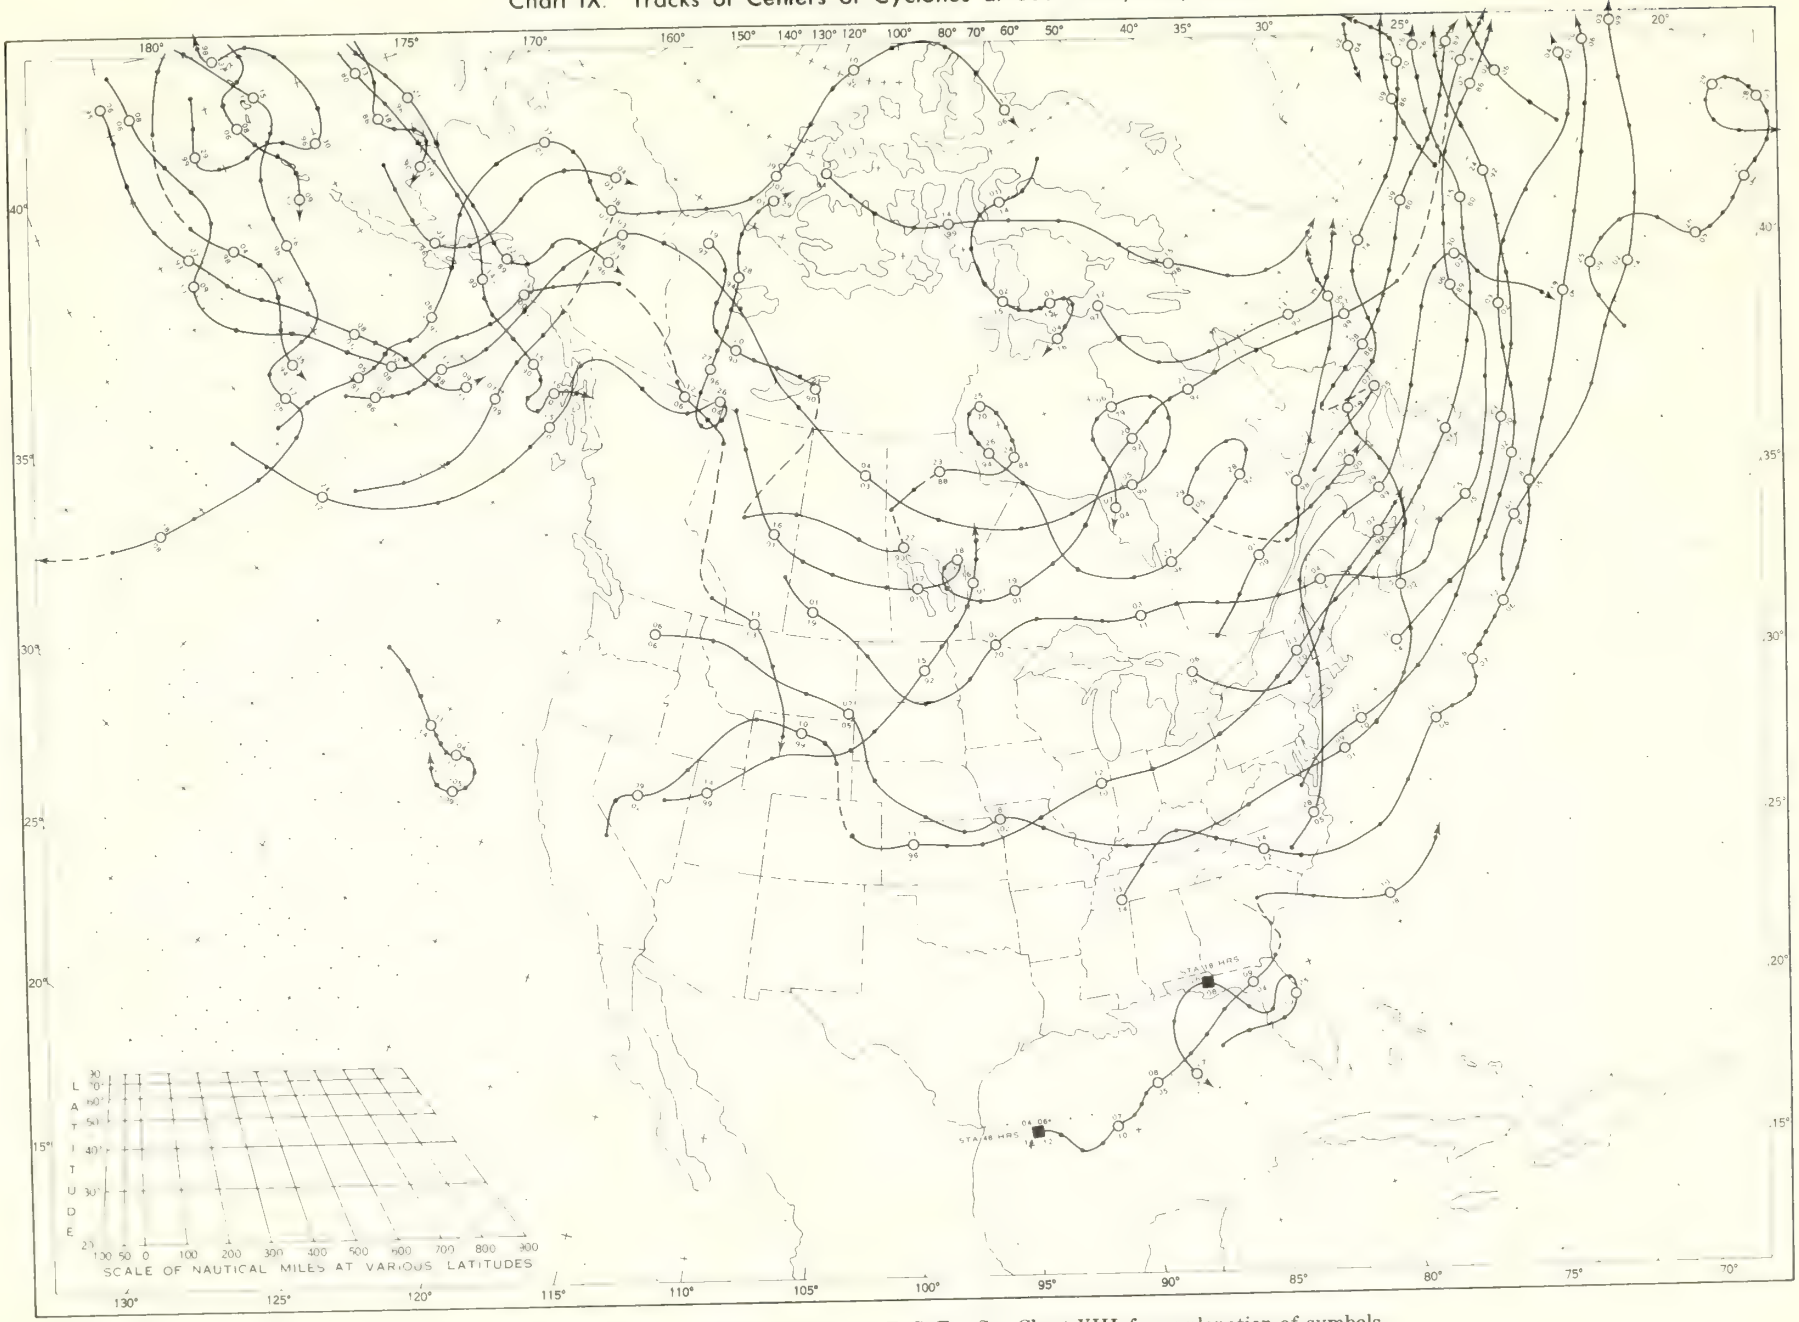
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm.$^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, May 1966.



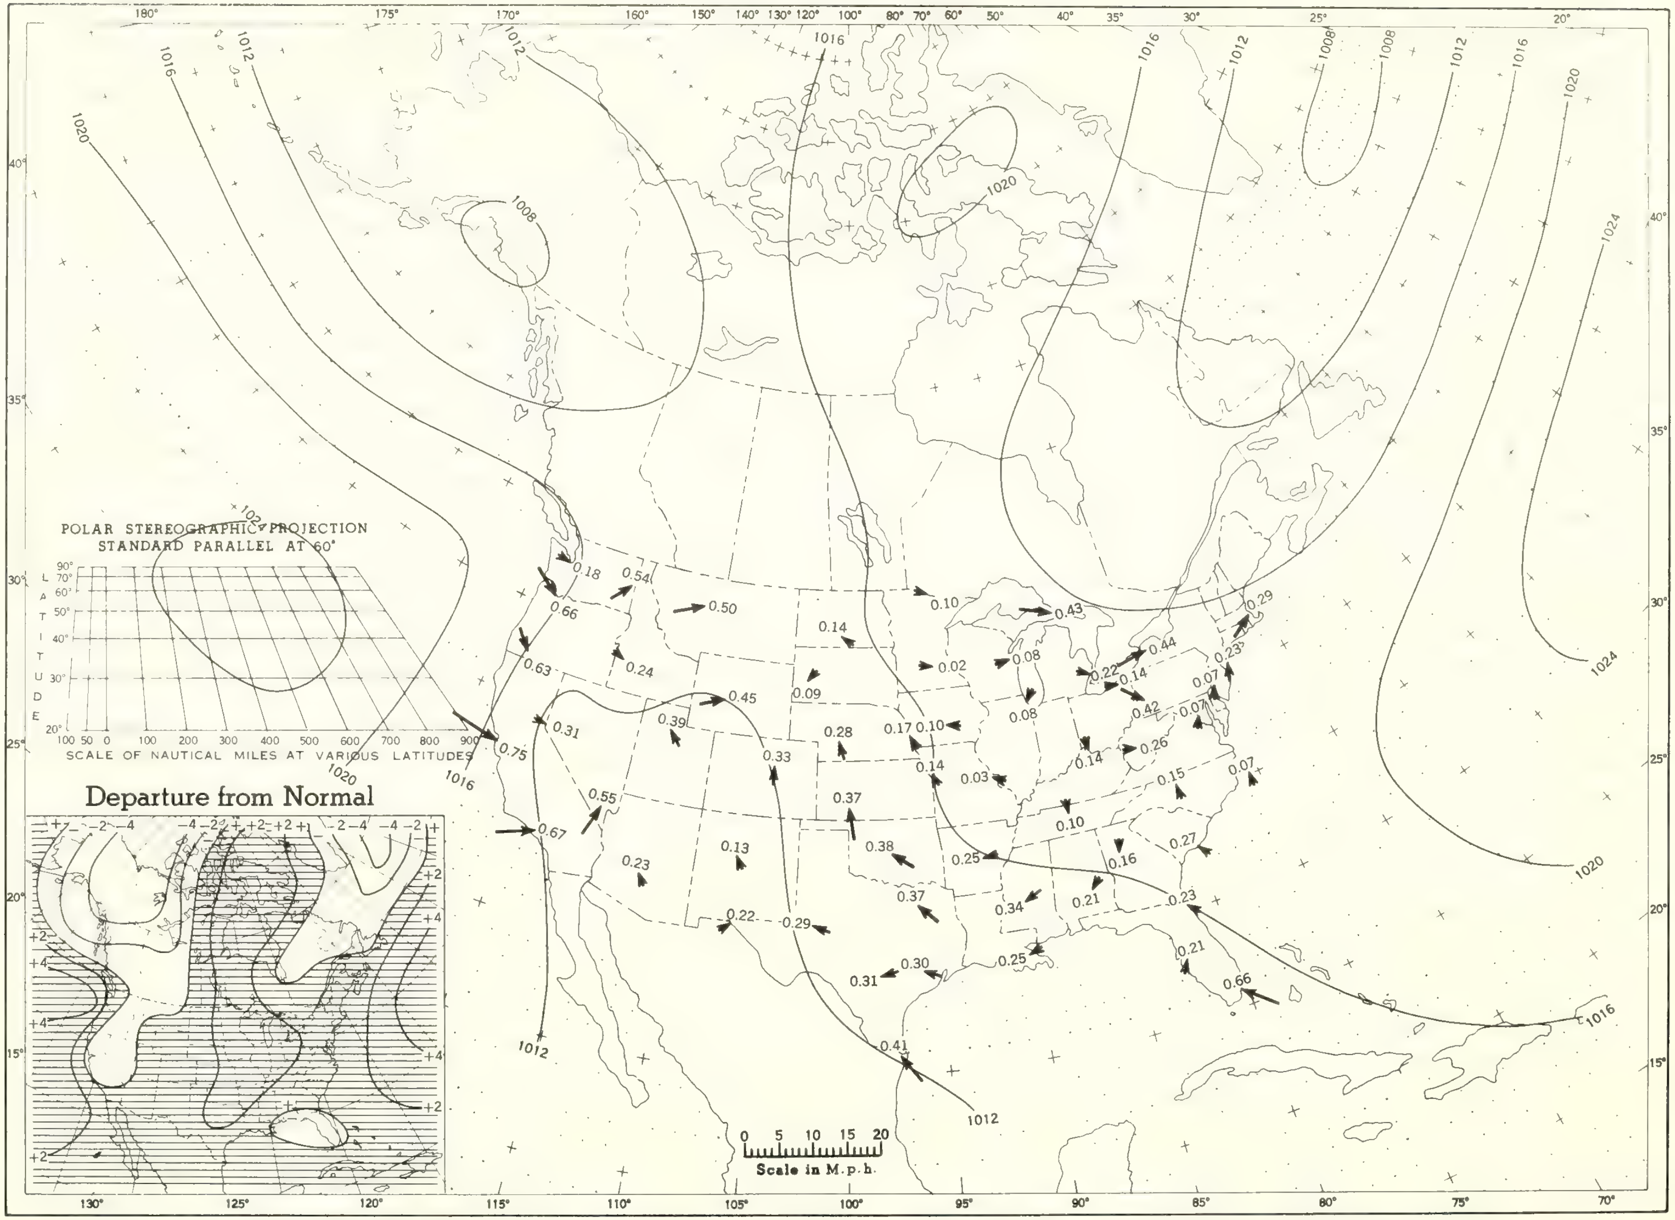
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, May 1966.



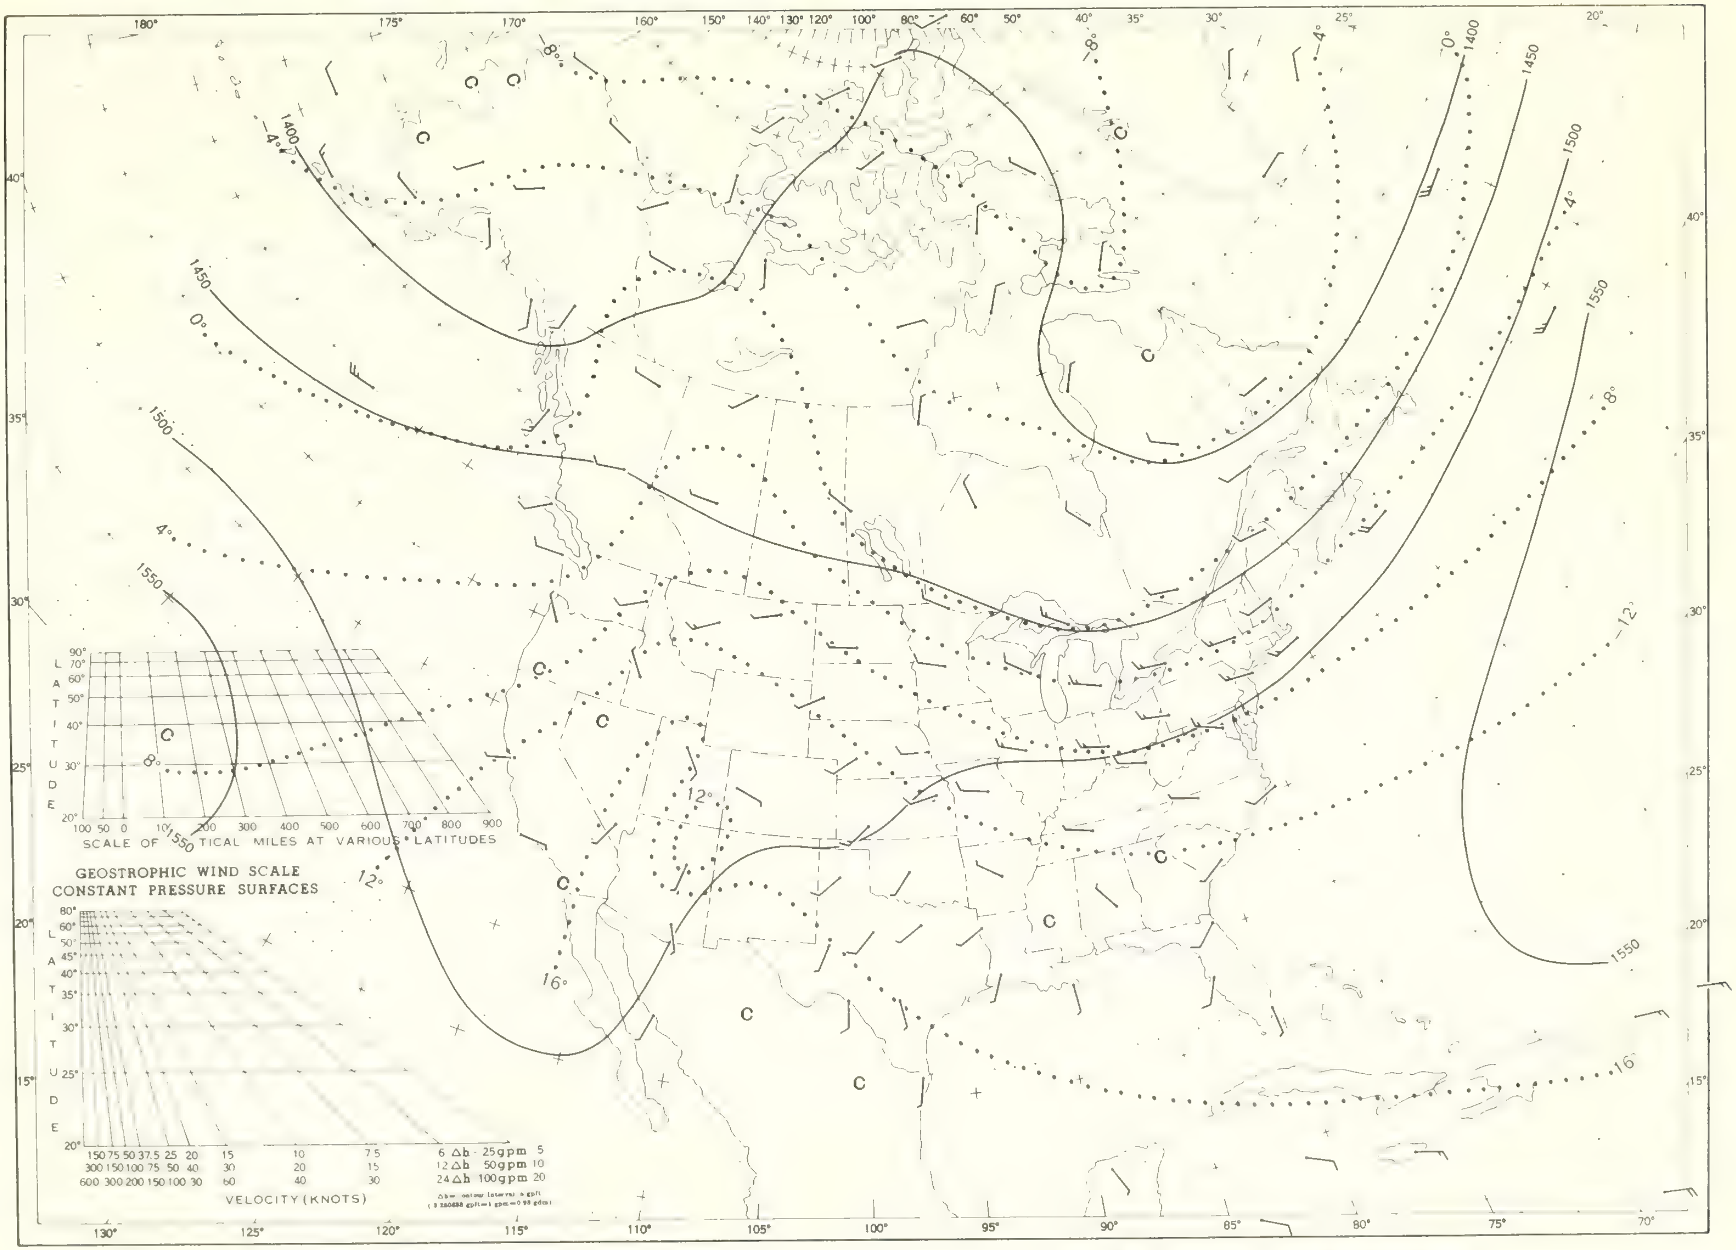
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, May 1966. Inset: Departure of Average Pressure (mb) from Normal, May 1966.



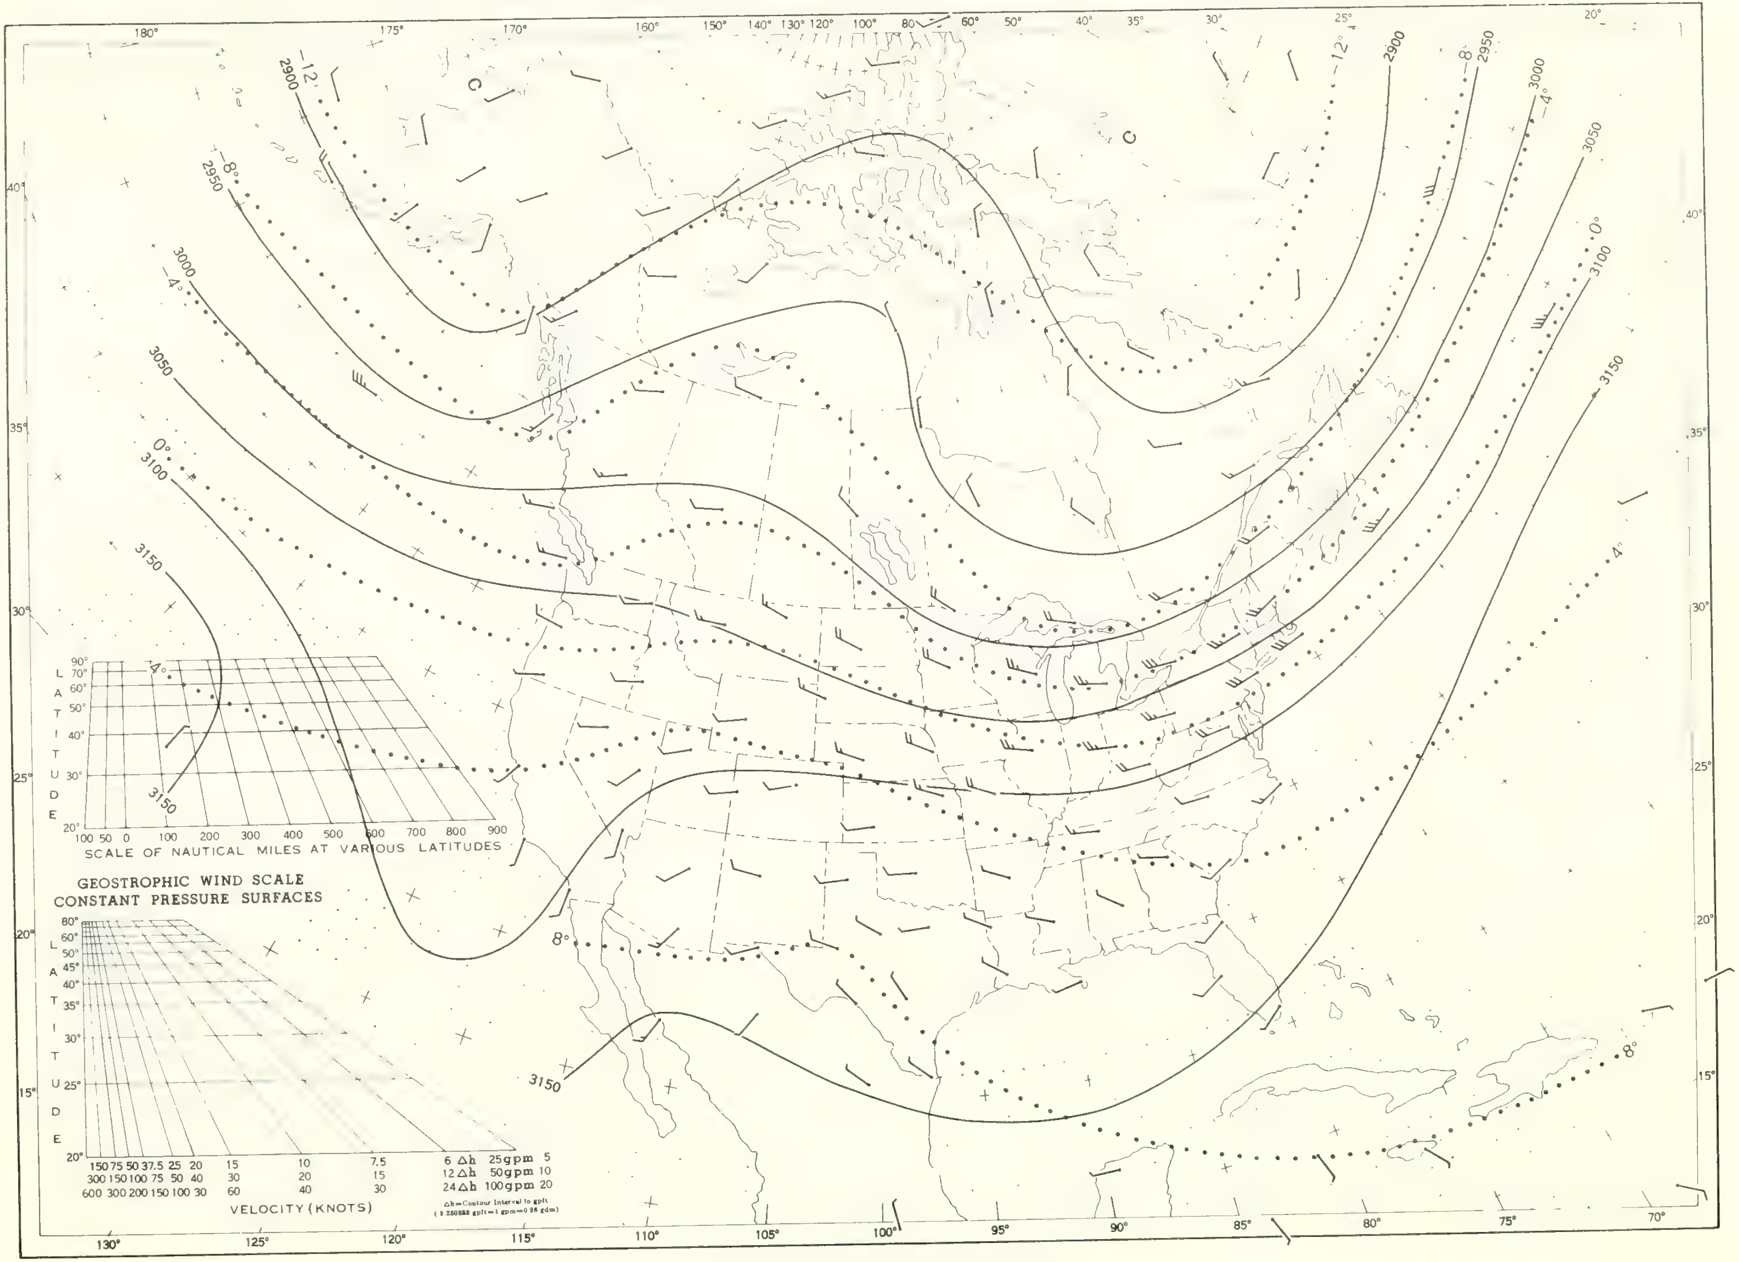
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, May 1966. Average Height and Temperature, and Resultant Winds.



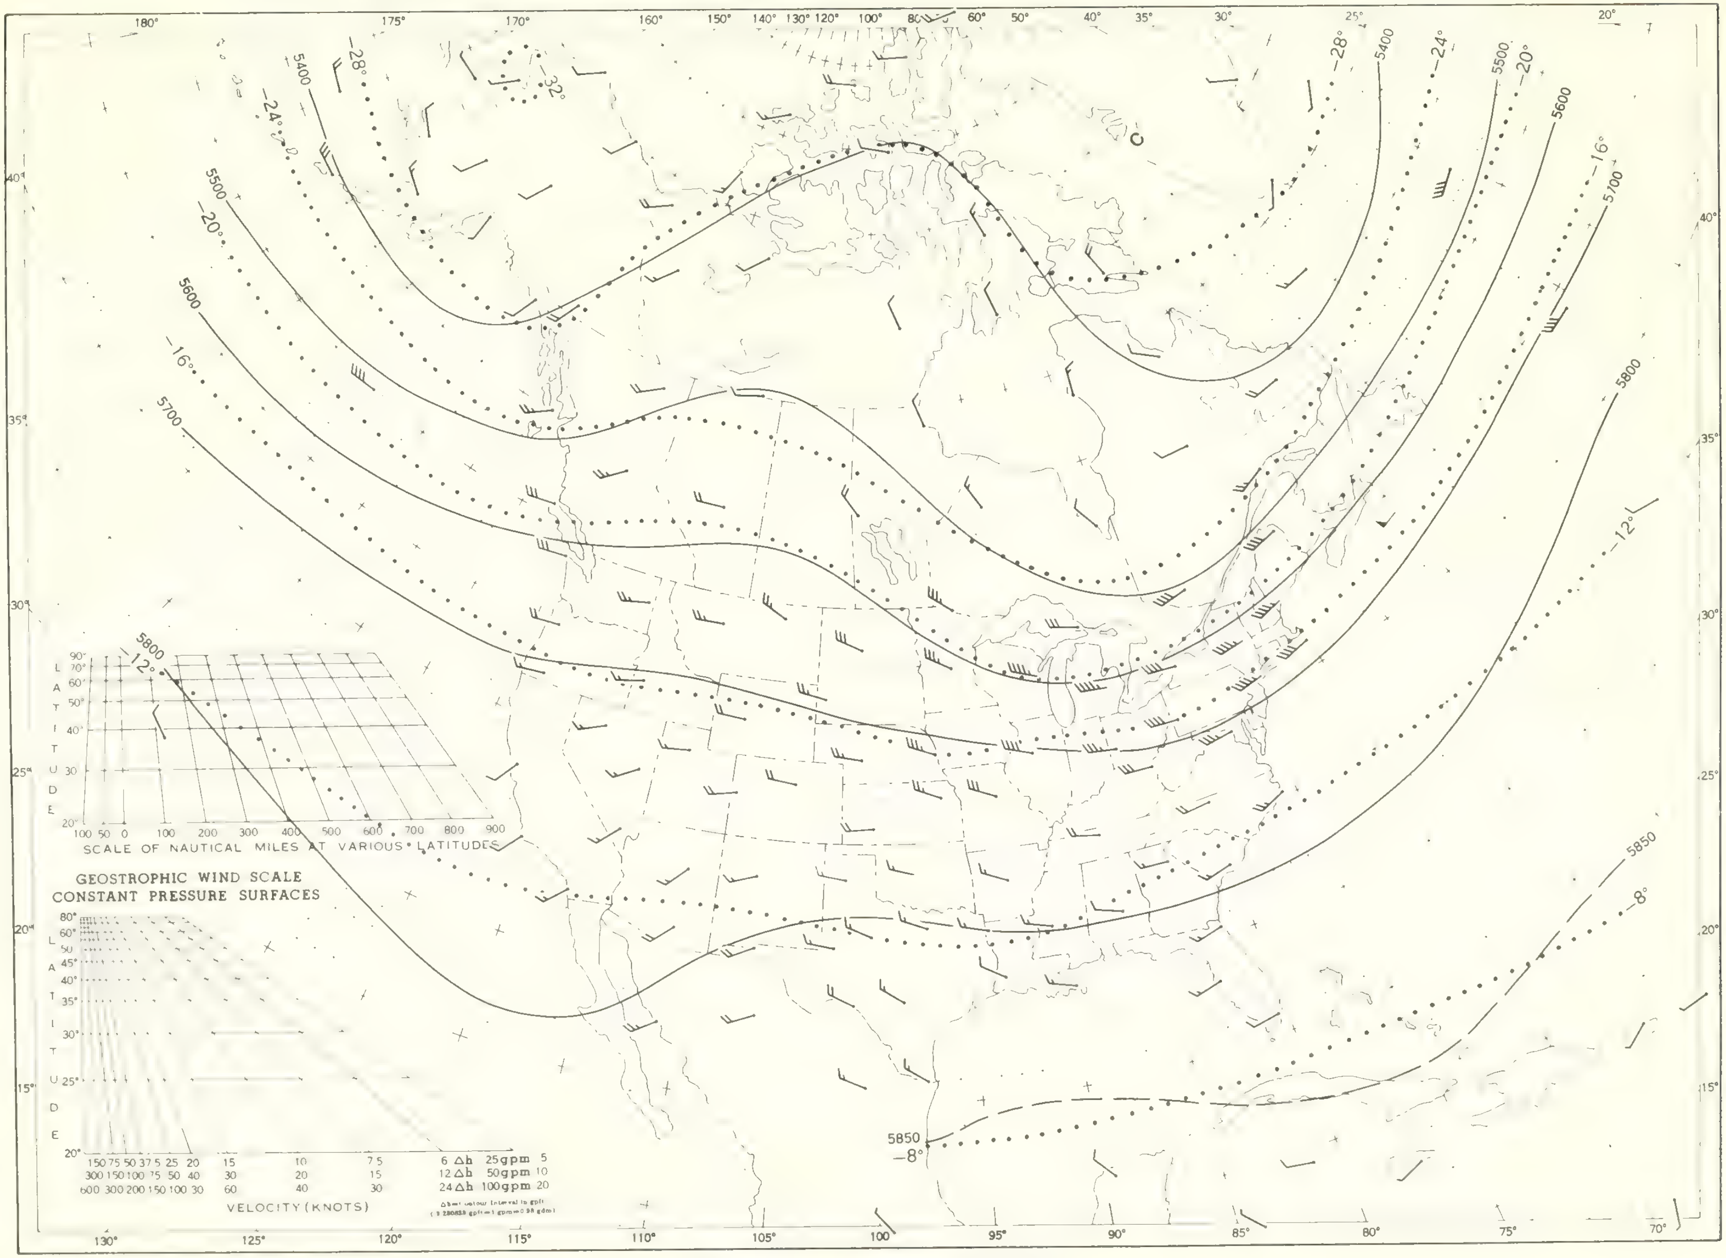
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, May 1966. Average Height and Temperature, and Resultant Winds.



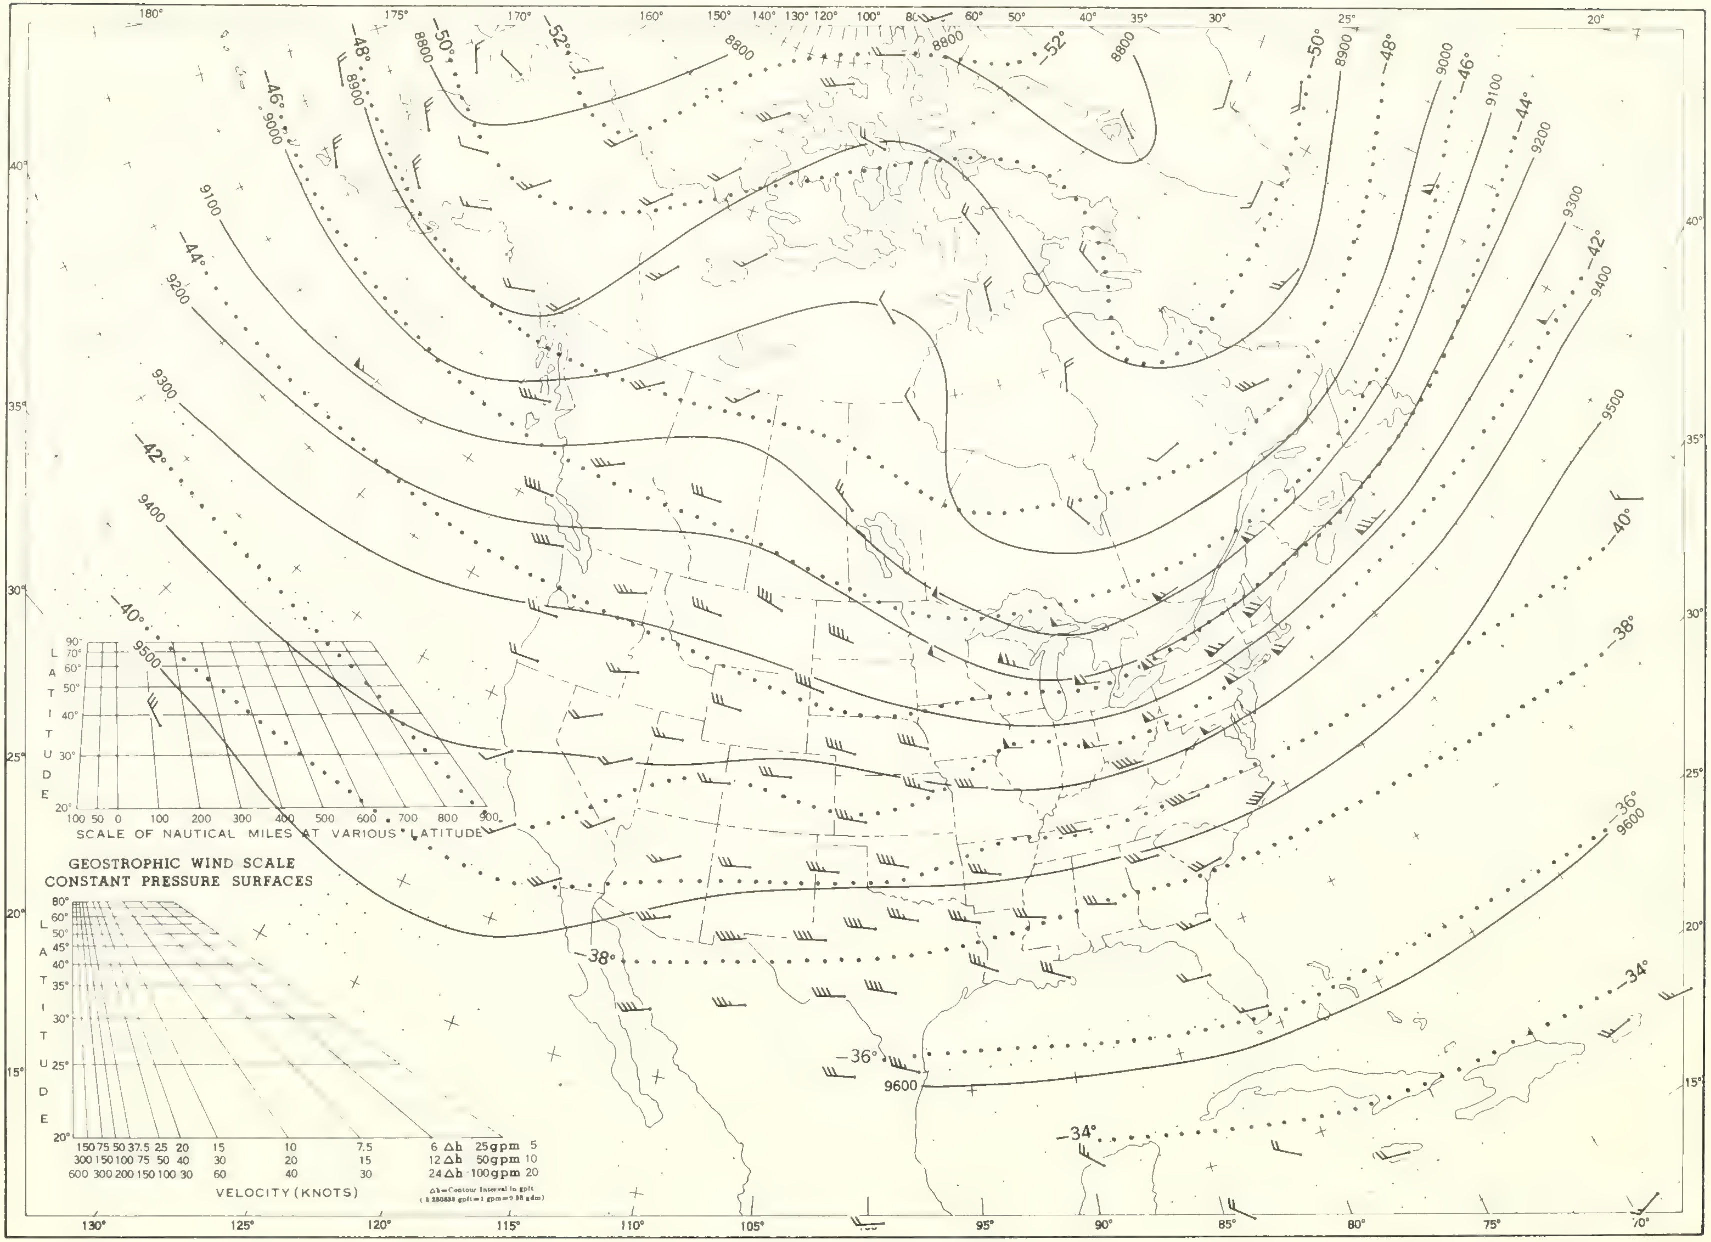
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, May 1966. Average Height and Temperature, and Resultant Winds.



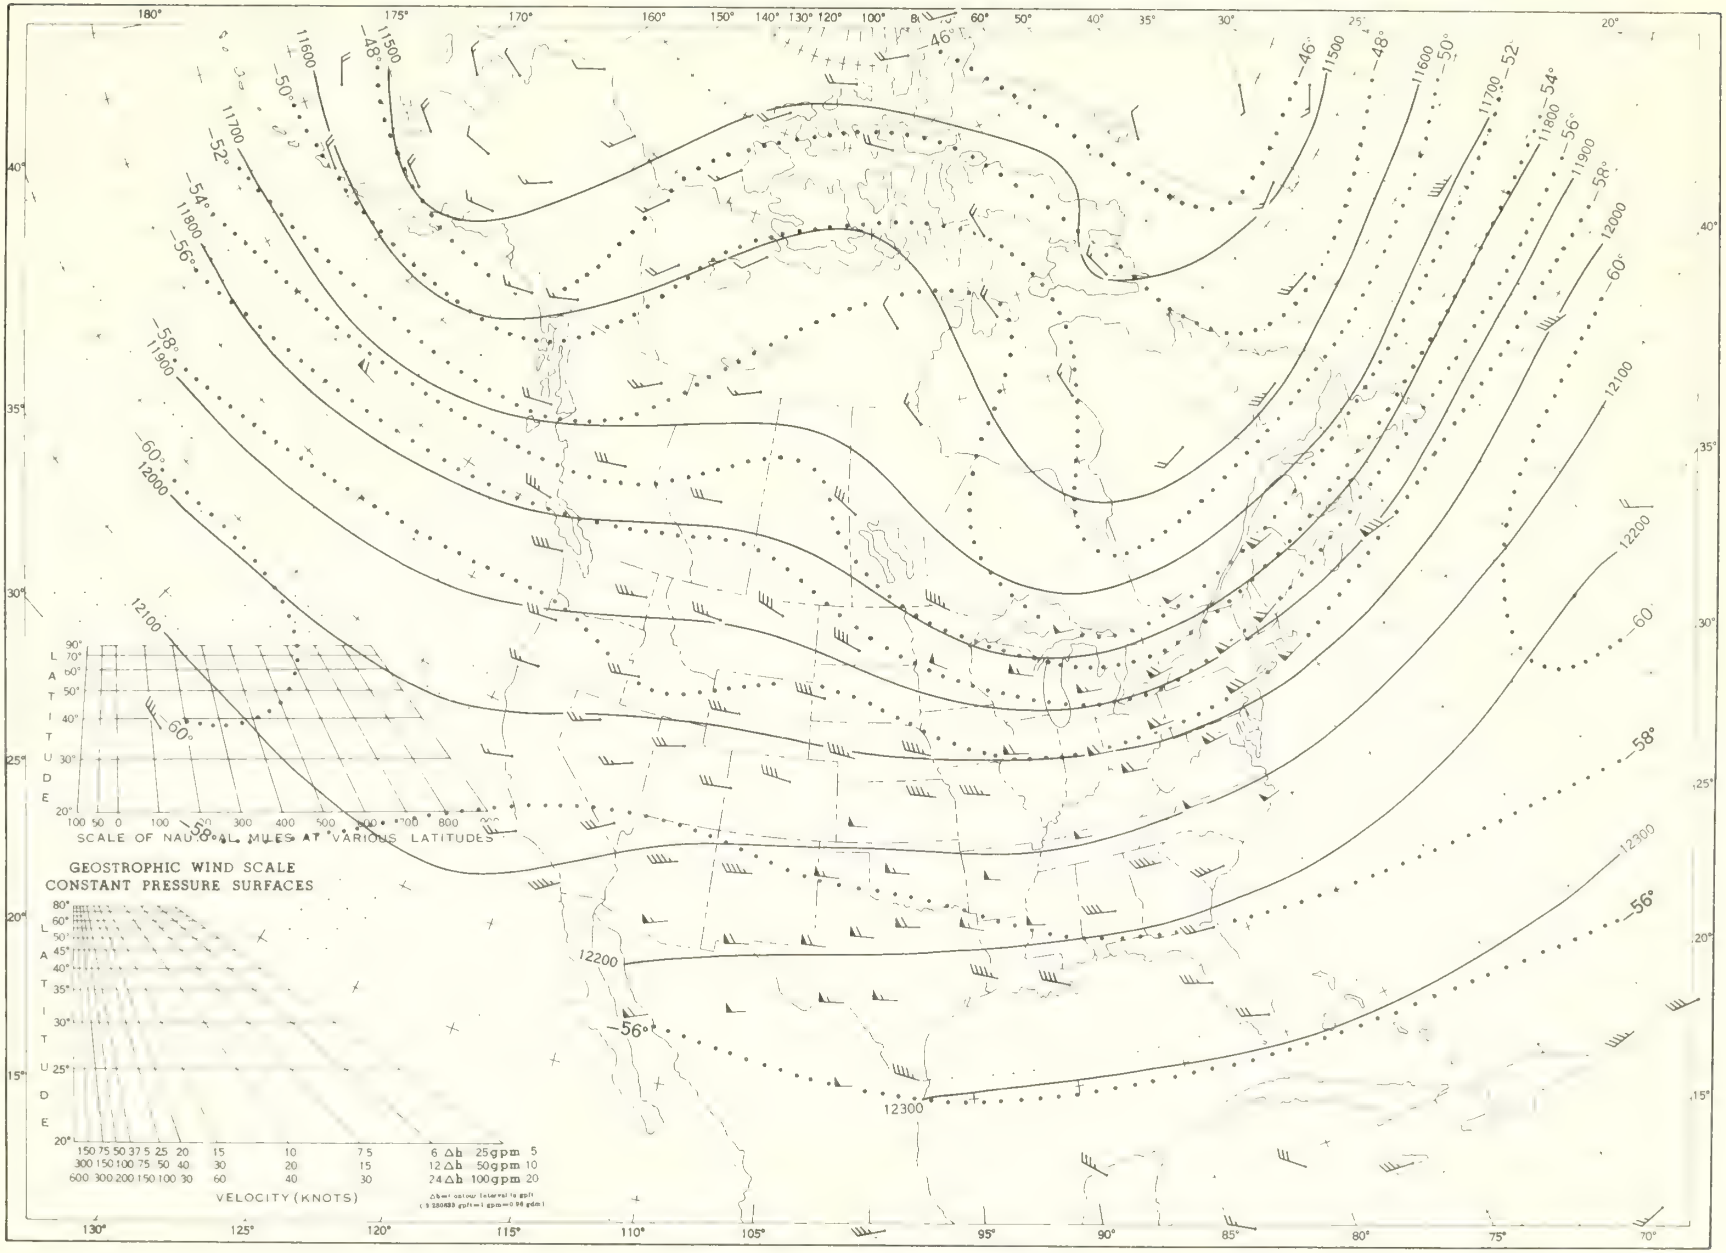
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, May 1966. Average Height and Temperature, and Resultant Winds.



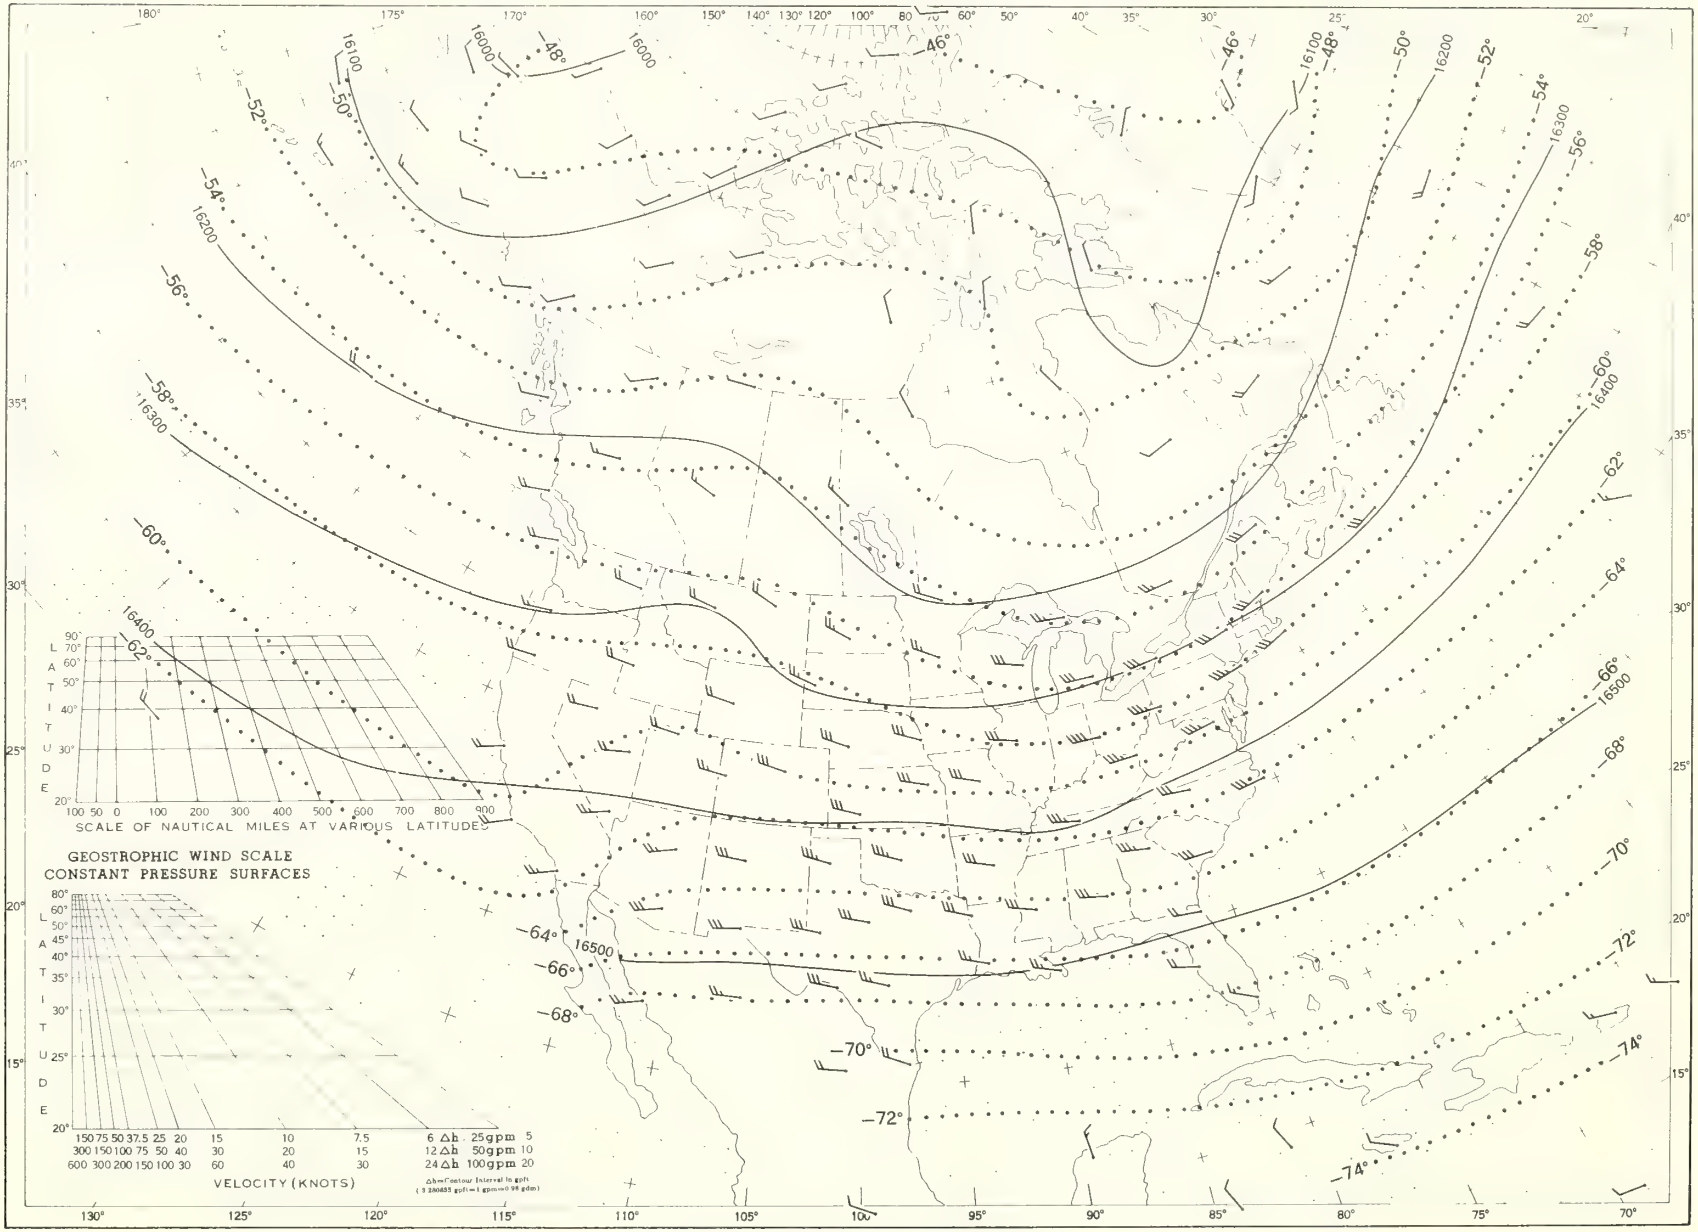
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, May 1966. Average Height and Temperature, and Resultant Winds.



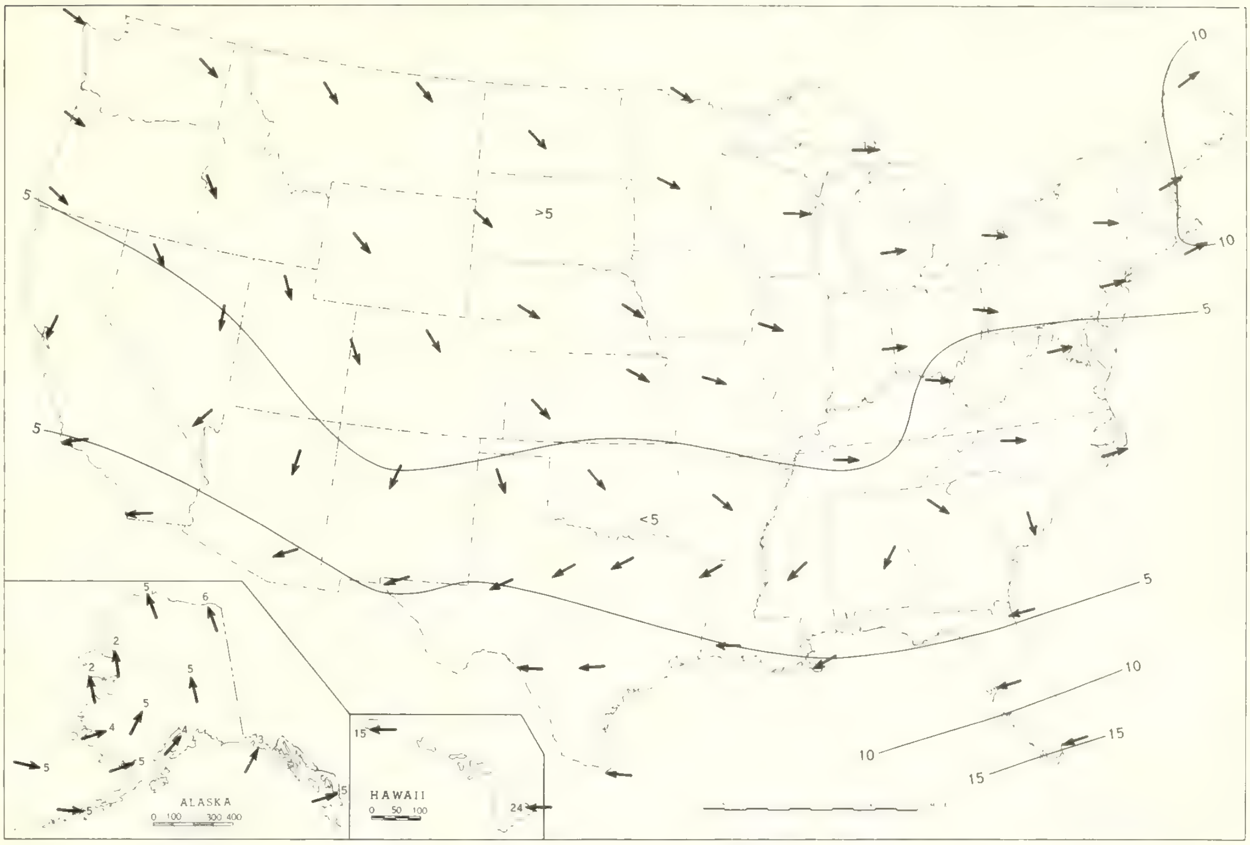
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, May 1966. Average Height and Temperature, and Resultant Winds.

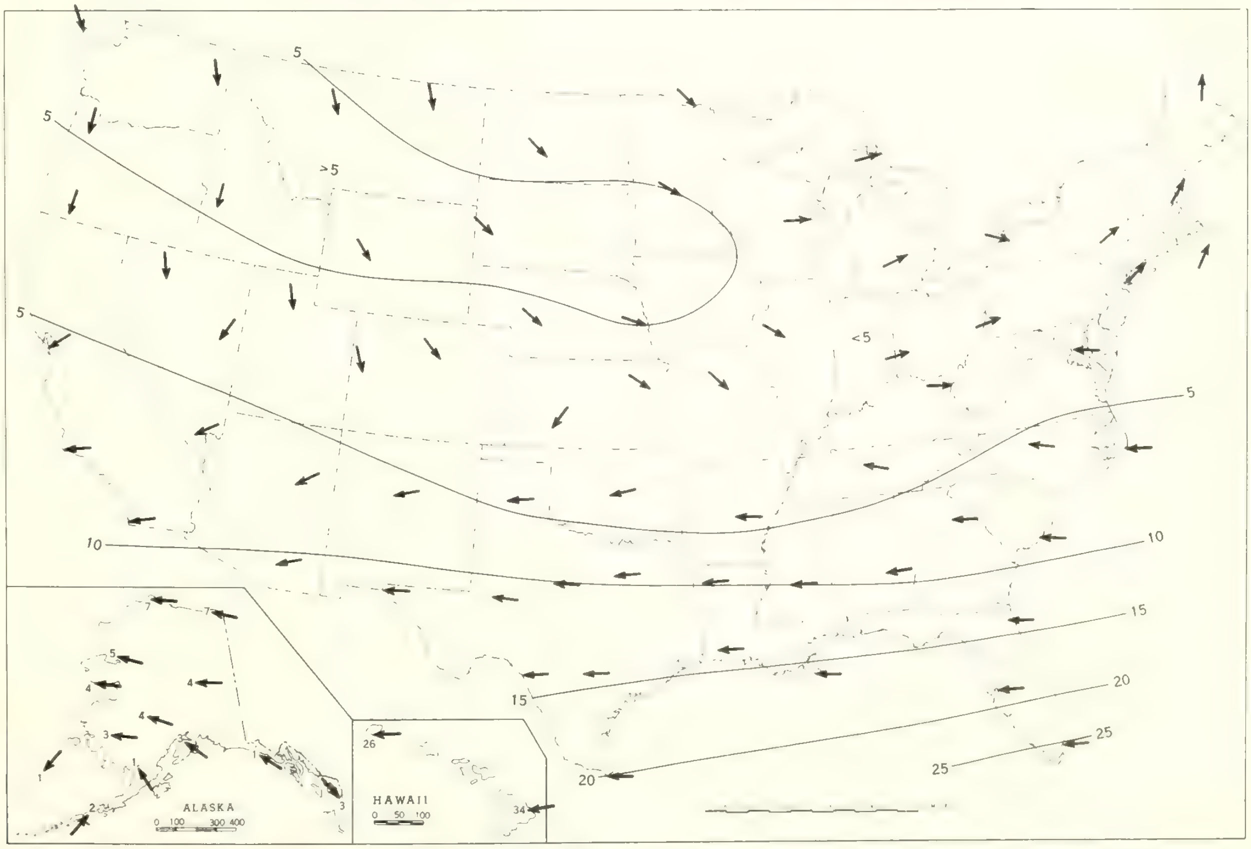


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, May 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, May 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 6 JUNE 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Topeka tornado.
2. Hurricane Alma.
3. Cold spell East.
4. Heat wave East.
5. Drought increases Northeast, West; Southeast wet.

TEMPERATURE.--The month was warm from the northern Mississippi Valley to the north Atlantic coast and also in the far Southwest. Below normal temperatures continued in the Southeast. Cool temperatures prevailed over most of the Country during the first half of June, but a warming trend became evident during the latter half of the month as a persistent continental high pressure system developed.

June began with a polar air mass intruding into the eastern half of the Country. Low temperature records were set in at least 35 cities in an area from the Great Lakes to the Gulf of Mexico and from Missouri to the Atlantic coast. Frost formed in the Apalachians as far south as North Carolina. Gradual warming occurred in the East by the second week as temperatures plunged in the central and northern Great Plains.

A heat wave in the Southwest sent temperatures well above 100° at midmonth. At the same time cool, dry air spread over the Midwest and East producing negative anomalies similar to those during the beginning of June.

The latter half of the month was marked by a persistent anticyclone that caused a heat wave from the Rockies eastward. Only the Pacific Northwest and the Southern States recorded below normal temperatures. The mercury soared to near or over 100° in a broad band from the Dakotas and Wyoming through the middle Mississippi and Ohio Valleys to the middle Atlantic coast, but the prolonged heat did not reach its climax until July.

PRECIPITATION.--Rainfall was generally light over the eastern half of the Nation, except the extreme Southeast, and drought conditions were intensified. Less than 25% of normal precipitation was received in a belt along the west-central Appalachians from Kentucky through Pennsylvania. The dryest June of record was experienced in Huntington, Parkersburg, and Charleston, W. Va., and Avoca, Pa. Harrisburg, Pa., also set a new dryness record with a monthly total of only 0.07 inch.

Frequent showers and two tropical disturbances drenched the southeastern Atlantic coast. June was the wettest June of record in Miami's history (21.4 inches), and it also had the least amount of sunshine and the lowest monthly temperature. One beneficial aspect of the rain, however, was the relief from the drought in the Everglades.

West of the Mississippi River, convective activity produced copious precipitation in Iowa, Nebraska, northwestern Missouri, northeastern Kansas, and New Mexico. Albuquerque, N. Mex., recorded its wettest, and El Paso, Texas, its second wettest June of record. Most other areas were deficient, especially north-central Texas and the Great Basin.

SEVERE STORMS.--The usual June wind, hail, electrical storms, funnel clouds, and tornadoes swept across the Country causing mostly minor property damage. Two unusually severe storms, though, were the Topeka, Kansas tornado on the 8th and hurricane Alma.

The Topeka tornado was one of 16 in Kansas and Oklahoma on the 8th and was the most destructive. At least 17 died and 550 were injured as the twister ripped through the heart of the city. 2,540 families and over 2,000 buildings were affected. Almost total destruction occurred along an 8 mile swath in downtown Topeka. All major structures on the Washburn University campus were damaged and several were a total loss. Damage estimates were in excess of $100 million, one of the highest totals of record for a single tornado.

The second week of June was also marked by hurricane Alma. This tropical storm was the first of the 1966 season and the earliest known to cross the United States coastline. It paralleled the Florida Gulf coast before turning in a northeasterly direction to travel along the Atlantic coast of Georgia and the Carolinas. Most of the damage resulting from the storm was in the form of salt-water flooding and beach erosion, downed utility lines, and washed-out beach roads. The coastal tobacco and late season vegetable crops also sustained some damage, but the rains in the inland areas were beneficial to the citrus crops.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70 F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

Note: "Heating Degree Days" has been discontinued in the June issues of this publication. Data which would usually be shown in that table for June are shown in the last three columns of the above Table.

HURRICANE ALMA, JUNE 4–14, 1966

Richard M. DeAngelis

Hurricane Alma, the first hurricane of the season and the earliest on record to cross a coastline of the United States, formed in an extensive band of cloudy, showery weather which extended from the western Caribbean to the Bahamas on June 4. Torrential rains, totaling up to 30 inches, fell over northern Honduras during the storm's formative stages, causing widespread flooding which resulted in an estimated 200 deaths. First detected as a tropical depression in the northwestern Caribbean on the 5th, Alma, plodding northward and rapidly intensifying, reached hurricane strength one day later some 340 miles south-southwest of Havana, Cuba. On the morning of June 8, the hurricane slashed across western Cuba, its 100 m.p.h. winds, heavy rains, and resultant high tides destroying over 47,000 acres of crops and more than 300 homes along the southern coast of Havana Province.

Accelerating to a forward speed of 17-20 m.p.h., Alma continued northward into the Gulf of Mexico and along the west coast of Florida. On the afternoon of the 8th, as the storm passed 50 miles west of Key West, Dry Tortugas, the westernmost portion of the Keys, recorded a minimum pressure of 28.65 inches and a maximum sustained wind of 125 m.p.h. These were the extremes observed at any land station during the hurricane's existence. Gale force winds lashed exposed coastal stations in southern Florida for up to 22 hours, with rain averaging 5-8 inches over Dade, Broward, and Palm Beach Counties and 2-4 inches in other southern counties. Tides were less than 1 foot above normal along the southeast coast but ran 2-3 feet above normal from the Keys to St. Petersburg and 3-5 feet above normal in Tampa Bay.

Early on the 9th, Alma, moving north-northwestward, passed 50 miles west of Tampa and by afternoon made landfall about 20 miles east-northeast of Apalachicola. Crawfordsville and Alligator Point estimated winds of 75-100 m.p.h. with an observed pressure of 29.06 inches at Alligator Point. Intensity and forward speed diminished as the storm turned northeastward, moving east of Tallahassee and reaching south-central Georgia by evening. Gale force winds extended over most of northern Florida although their duration was considerably less than in the southern sections. Total rainfall amounts were generally 2-4 inches over the northern portions of the peninsula increasing to more than 6 inches in the path of the storm and decreasing rapidly over the western portion of the panhandle. The concave nature of the Florida coastline from Tampa to Apalachee Bay along with the offshore movement of the hurricane caused tides of 4-10 feet above normal along this stretch of coastline.

Traversing southeastern Georgia late on the 9th and the 10th, Alma diminished to a tropical storm, then moved north of Savannah off the South Carolina coast that afternoon. Gale force winds occurred in gusts along the coasts of Georgia and South Carolina, while precipitation totals averaged 2-4 inches in southeastern Georgia and along the South Carolina coast. Tides ran 2-3 feet above normal. The following day Alma continued moving east-northeastward out into the Atlantic and on the 11th-12th briefly reintensified to hurricane strength but quickly diminished to tropical storm intensity as she swung northward. During this period coastal sections of North Carolina were battered by gale force winds, tides 2-5 feet above normal, and 4-8 inches of rain. Gusty winds nearing gale force buffeted coastal areas from Virginia to New England as Alma continued to parallel the east coast. During the afternoon of the 13th the storm became extratropical about 120 miles east-southeast of Atlantic City, New Jersey. The fast moving extratropical LOW turned northeastward late on the 13th passing to the west of Cape Cod and out into the North Atlantic by the morning of the 14th.

DAMAGES.--Total storm damage in Florida is estimated near $5 million. A major portion of the damage was the result of tidal inundation and beach erosion. Hardest hit was the Tampa - St. Petersburg region where an estimated $1.25 million worth of damage resulted from flooding and high winds. Direct wind damage along the west coast was mainly to power and communication facilities, residential roofs, trees, and glass breakage. Salt water inundation caused minor damage to roads and homes from the Keys to Apalachee Bay. Crop damage was most extensive in the northern farming areas where heavy rains and high winds damaged corn and tobacco fields. Rain, however, was mostly beneficial especially to the citrus crop. Storm damage in the other states was generally light with some disruption of electrical service, spotty beach erosion, and minor crop damage resulting from the high winds and locally heavy rains.

A total of 9 storm-connected tornadoes were reported during the hurricane's existence, 8 of them occurring in Florida. The tornadoes occurred at Cayman Brac, Cayman Islands (evening, June 6); southern Dade County (noon, June 8); near Miami (10:00 p.m., e.s.t., June 8); Jacksonville (afternoon, June 9). Three tornadoes occurred near Sarasota between 10:30 p.m. and 11:00 p.m., e.s.t., June 8. Two tornadoes occurred near Marianna at 6:00 a.m. and 10:00 a.m., c.s.t., June 9.

DEATHS.--Excluding the unknown total in Honduras, hurricane Alma has claimed a total of 19 lives. Twelve people lost their lives in Cuba, 6 in Florida, and 1 missing and presumed dead in Georgia.

† Storm damages are placed in categories varying from 1 to 9 as follows:

1	Less than $50
2	$50 to $500
3	$500 to $5,000
4	$5,000 to $50,000
5	$50,000 to $500,000
6	$500,000 to $5,000,000
7	$5,000,000 to $50,000,000
8	$50,000,000 to $500,000,000
9	$500,000,000 to $5,000,000,000

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

JUNE 1966

Elmer R. Nelson, Office of Hydrology

The most damaging floods during June occurred along small creeks in southeastern Iowa, southwestern North Dakota, and south-central Nebraska. Crests ranking second to third highest were recorded in the Skunk River basin in Iowa. Sappa Creek at Stamford, Nebr., exceeded the previous highest stage of record reached in 1947 by nearly 2 feet. The flash flooding of small creeks flowing into the Knife and Heart Rivers in North Dakota were considered by older residents as the most severe in history.

ATLANTIC SLOPE DRAINAGE

Heavy local rains from May 22 through May 27 caused flooding along the Lumber River at Lumberton, N. C., from May 23 to June 6. Addditional heavy rains on June 9-11 caused additional overflow at Lumberton, N. C., from the 11th to the 18th. Minor flooding occurred on the Little Pee Dee River at Galivants Ferry, S. C., beginning during the latter part of May and ending on June 7. Additional flooding occurred from the 14th to the 20th. Moderate overflow occurred on the Edisto at Givhans, S. C., from May 27 to June 5. This was followed by light flooding from the 19th to the 26th. Slight inconvenience resulted from the flooding along the Edisto during June.

Minor flooding occurred on the lower portion of the Savannah and Ogeechee Rivers in Georgia during the latter part of May and the first few days of June. Damage, if any, was light.

Minor flooding occurred on the Oconee River at Mount Vernon, Ga., on the 6th and on the Altamaha River at Charlotte, Ga., on the 7th. Heavy rains in southern Georgia, totaling 13.6 inches at Folkston, caused the Satilla River to go above flood stage on May 27, cresting 2 feet above flood stage on June 1. It continued in flood until June 10. Additional heavy rains from June 16 to 19 caused minor flooding from the 19th to the 25th.

EAST GULF OF MEXICO DRAINAGE

The high water on the Apalachicola River at Blountstown, Fla., from May 31 to June 3 was due to heavy rains during the latter part of May. No damages resulted from the light flooding since only lowlands were inundated. Logging operations which had been curtailed by the high water returned to normal shortly after the end of the flooding.

The Coosa River at Gadsden, Ala., which went above flood stage on April 28 continued above 20 feet into the first part of June. The heavy rain on April 26-30 was sufficient to fill the reservoir above the recently completed Lock 3. The pool kept the stage at Gadsden above 20 feet for an extended period.

The Pearl River at Pearl River, La., which began overflowing its banks on May 25 continued above flood stage until June 4. The crest on May 29 was 1.6 feet above flood stage.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Very heavy rains during the night of the 11th and early morning of the 12th, caused some severe flooding on small streams in Iowa. Rainfall amounts of 2 to 5 inches were reported over an area 35 to 50 miles wide from Audubon to Huxley to Grinnell. Streams in this area were already high from the moderate to heavy rains of the 8th and 9th. The Skunk River at Oskaloosa, Iowa, was already in flood on the 10th. The additional heavy rains caused the Skunk to reach a crest which ranked third highest of record. The most serious flooding occurred on the North Skunk at Sigourney, Iowa, which crested nearly 8 feet above flood stage on the 14th. This crest was the second highest of record. In the Four Mile Creek area, 40 families were evacuated as the creek rose about 5 feet above its banks. The Black Hawk Creek at Hudson, Iowa, rose 2.7 feet over its banks on the 13th before receding within its banks on the 14th. The Des Moines River and tributaries in the reach from Des Moines to Ottumwa, Iowa, rose 1 to 4 feet above flood stage between the 11th and 18th. Flood damages were mainly to cropland. Much of the corn in the flooded areas had to be replanted. In areas where the flood waters were slow in receding it was replanted with soybeans. Heavy rains on the 28th caused additional flooding on the North Raccoon at Jefferson, Iowa.

The Illinois River was in flood in the beginning of the month in the reach at and below Chillicothe, Ill. It receded within its banks at Chillicothe, Ill., on June 1. The heavy rains on May 23 prolonged the flooding in the reach to Beardstown, Ill., from May 29 to June 7. Flooding continued at Meredosia, Ill., until June 18. The crests on May 25 ranged from 4 to 8 feet above flood stage. Heavy rains on June 13, totaling 2 to 4 inches, produced flooding on the Salt River at New London, Mo., from the 13th to the 17th. It crested on the 15th, 2.6 feet above bankfull stage.

Missouri Basin.--Severe flash flooding occurred in the southwestern quadrant of North Dakota from excessive rains on June 24. The torrential rains occurred over an area 10 to 20 miles wide extending from near Riverdale through extreme eastern Mercer County, most of the western half of Oliver County, extreme western Morton County, and extreme southeastern Stark County. The greatest amount of rainfall officially reported was 6.5 inches at Glen Ullin and 4.15 inches at Riverdale. Between these towns there were unofficial reports of rain estimated from 10 to 15 inches. Most of the rain fell in a period of approximately 3 hours or less beginning near noon on the 24th.

The heaviest rain fell in the headwaters of Square Butte Creek, Otter Creek, and Big Muddy Creek. Square Butte Creek, which rises in west-central Oliver County, northwest of Hannover overflowed its banks in the town of Center about 5:30 p.m. on the 24th. About one-third of the population had been evacuated to higher ground before the flood waters reached the town. Big Muddy Creek, which rises just northwest of Glen Ullin, flooded the entire town of Almont. The entire population had been evacuated before the flood. Otter Creek in western Oliver County, which flows northward to the Knife River between Hazen and Beulah, overflowed rapidly causing considerable damage to farms. In some cases all the farm buildings were destroyed and in others, the house and perhaps the barn survived but with considerable damage. Many of the older residents of eastern Mercer County and most of Oliver County considered this as the worst flood in history. Bridges and roads were washed out, livestock drowned, and complete sets of farm buildings destroyed. Damages to roads, bridges, and culverts in seven counties were estimated at $1.7 million. Practically every coulee, creek, and river was full to overflowing with the Knive River being out of its banks and running nearly a mile wide in many places.

The James River at Columbia, S. Dak., was out of its banks from March 15 to June 11. It crested 5.2 feet above flood stage on April 1-3. At Stratford, S. Dak., the James continued in flood from March 25 to

July 14 for a total of 111 days. It crested nearly 3 feet above flood stage on April 11. The main loss from the flooding was agricultural. As much as 40,000 acres of land was flooded during the peak of the flood.

Moderate to heavy rains during the night of the 11th and 12th caused brief flooding on the Nishnabotna River in southwest Iowa. The rainfall over the East Fork of the Nishnabotna River ranged from 2 to over 4 inches.

Heavy flooding occurred in the Republican Basin on the lower portion of Sappa Creek between the 23d and 26th. At Stamford, Nebr., a record crest of 22 feet, 8 feet above flood stage was observed on the 24th. The previous highest stage of record was 20.1 feet observed on June 22, 1947. A moderate overflow extended upstream to near Beaver City, Nebr., between the 23d and 25th. Light to moderate flooding occurred on Prairie Dog Creek at Woodruff, Kans., on the 24th and 25th. Light to moderate overflows were recorded on lower Stranger Creek near Tonganoxie, Kans., on the 13th and in the upper portion at Easton, Kans., on the 27th. Light flooding was reported on the extreme lower Delaware River on the 13th and on the South Fork of the Republican River near St. Francis, Kans., on the 18th. Flooding resulted from local torrential rains preceded by general rains of 1 to 2 inches on the 7-8th.

Moderate to heavy rains on the morning of the 8th caused flooding on the Little Blue River near Lake City, Mo., on the 8th and on the upper Blackwater River near Knob Noster, Mo., on the 9th.

Heavy rain on the 12th and 13th produced widespread flooding on the southern and eastern tributaries of the Missouri River from the 13th through the 18th. Minor overflow occurred on the Missouri River at Boonville, Mo., on the 14th and 15th. Heavy inflow from Brush Creek, caused the Blue River at and below Highway 50 in eastern Kansas City, Mo., to go 5 to 6 feet out of its banks. There was considerable flooding of small streams during the night of the 12th and 13th. Heavy rains fell again during the night of the 25th and 26th in southwestern Iowa and on the following night in northwestern Missouri and southeastern Nebraska. Several stations reported amounts of 4 inches or more. Flooding resulted on the Nishnabotna in Iowa and on the Platte near Agency, Mo., on the 26th and 27th. Some lowland flooding was reported at Platte City on the 27th and on Wolf Creek at Syracuse, Nebr., on the 27th and 28th.

White Basin.--The Cache River at Patterson, Ark., continued in flood from April 21 to June 17 for a total of 57 days. It crested at a stage of 10.4 feet, 1.4 feet above flood stage on April 30-May 4. No additional damages resulted from the flooding during June.

Red Basin.--The Sulphur River at Naples, Tex., was out of its banks from April 25 to June 25 for a total of 61 days. It crested at a stage of 36.3 feet, 14.3 feet above flood stage on May 3. This overflow was due to 13 to 14 inches of rain during the last decade of April.

WEST GULF OF MEXICO DRAINAGE

Excessive rains during the last decade of April caused severe flooding in the Sabine Basin in Texas which continued into June in the lower basin. Flooding continued at Bon Wier, Tex., from May 7 to June 2 and at Deweyville, Tex., from May 6 to June 7. Extensive lowland flooding near the river necessitated moving livestock to higher ground. Fishing camps along the river were flooded and some overflow into the yards of homes occurred. Some of the roads near the river were flooded and had to be closed.

Recurring heavy rains during May produced flood conditions in the lower Trinity at and below Liberty, Tex., from May 25 into June. Flooding ended at Liberty on the 7th and at Moss Bluff, Tex., on the 18th. Significant rainfall over the upper Trinity on the 13th followed by heavy rainfall from the 16th to the 20th caused a slow rise along the Trinity at Long Lake, Tex., beginning on the 15th. This rise continued downstream during the remainder of the month, causing additional overflow at Moss Bluff beginning on the 20th and continuing through June. Damage from flooding was heavy.

Minor flooding which was occurring in the beginning of the month on the middle Nueces near Tilden, Tex., continued until the 4th. In the extreme lower portion, the Nueces was in flood at Calallen, Tex., from May 29 to June 1. Some streets, roads, and fields within a radius of 50 miles of Corpus Christi, Tex., were flooded briefly in numerous heavy showers on the 14th and again in the late afternoon of the 18th. More than 6 inches of rain was reported near Taft, Tex., on the latter date. On the morning of the 22d, rainfall amounts of 1 to 2 inches caused street flooding in parts of Corpus Christi.

S	Slight haze - indeterminable	HM	Moderate haze
M	Moderate haze - indeterminable	HI	Intense haze
I	Intense haze - indeterminable	*	Values corresponding to true solar noon

Langley is the unit used to denote one gram calorie per square centimeter. An explanation of the formula used in computing the air mass values for each station listed above appears in the February 1957 issue, Vol. 8, No. 2, page 63, of this publication.

SOLAR RADIATION DATA

Daily totals and monthly averages of solar radiation (direct and diffuse) received on a horizontal surface, tabulated in langleys.

NET RADIATION

Net radiation in langleys per day (midnight to midnight) at Huntley, Mont. JUNE 1966

Date.	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Avg.
Langleys. . .	428	377	123	338	340	448	274	180	440	211	172	349	368	115	260	422	327	331	415	429	329	73	324	274	389	434	433	423	378	245		322

The measurement is made with a Beckman and Whitley net exchange radiometer over a plot of sod. The value represents the total incoming minus the total outgoing radiation of all wave lengths.

These data are of an experimental nature and are published as received from the Huntley Exp. Station. The instrument with which they were measured has not been checked by the Weather Bureau.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

Station	Day of month																															
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	Mean O3
															Data will be delayed																	

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

CORRECTIONS

	Month: Annual 1964
page 31: Green Bay, Wis.	The reference letter Y should be deleted for fastest mile in wind speed column.
pages 32-41: Metric Table	In the Wind column, Average speed: multiply each value by 0.868, under Fastest mile multiply each value by 8.68. Slight differences from direct conversions derive from the arithmetic rounding of figures.
	Month: May 1965
page 266: Minnesota	Tornado damage should be 8.
	Month: December 1965
pages 623, 630: Green Bay, Wis.	The reference letter Y should be deleted for fastest mile in wind speed column.
	Month: April 1966
page 182: Georgia	In column "all others" damage should be 5 under both property and crops.

RAWINSONDE DATA REFERENCE NOTE:

Note: All observations scheduled at 1200, G.C.T. Pressures shown under station names are the average monthly station pressures for the month of record, corrected to the height of the floors of the instrument shelters used for rawinsonde purposes. "Number of observations" refers to those of dynamic height only. Although the number of temperature observations at any given pressure surface is usually the same as for height, it is possible for temperature to be missing for one or more pressure surfaces of some observations. Relative humidity averages are limited to those observations with temperatures warmer than -40°C. Observations of wind speed and direction are sometimes lost due to limiting angles, i.e., elevation angles less than 6° above the horizon, or any obstruction above the horizon.

The temperature and wind values are based on 15 or more observations at the surface or 5 observations at a standard pressure level for temperature and 10 for wind. Relative humidity data are not published for standard pressure surfaces for which less than 5 observations are available.

Relative humidity data are computed and expressed on the basis of vapor pressure over water. Unless otherwise indicated, they are obtained from carbon hygristors.

These average values for standard pressure surfaces were obtained by rawinsondes, dynamic height (geopotential) in units of .98 dynamic meter, temperature in degrees Celsius, relative humidity in percent, and resultant winds in degrees and knots.

* Rawinsondes at this station were equipped with hypsometers to permit more accurate evaluations of pressure, and consequently height, at pressures lower than 50 mb. These rawinsondes were carried aloft by special high altitude balloons, in an effort to consistently reach higher altitudes.

+ Observations for these stations are scheduled at 0000 G.C.T.

R More than half of the observations are from statistical values. Equipped with lithium chloride hygristor.

‡ Upper air program transferred to Victoria, Texas

Note. --Langley is the unit used to denote one gram calorie per square centimeter.
Values with an asterisk are interpolated.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λsΩΩΩ defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded ΩΩΩ) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λs designates the type of measurement made.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i.e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e.g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code ʌ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g. 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code ʌ s designates the type of measurement made.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λs Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

The spectrophotometer measures the total amount of ozone in the atmosphere, i. e , the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

TOTAL OZONE DATA

These provisional ozone data are obtained from measurements made with a Dobson ozone spectrophotometer, and are applicable approximately to local apparent noon. The data are presented in the code λ s Ω Ω Ω defined in the August 1962 WMO circular entitled "PUBLICATION OF DATA FOR METEOROLOGICAL RESEARCH, WORLD OZONE DATA."

Units: Milli-atmo-cms.

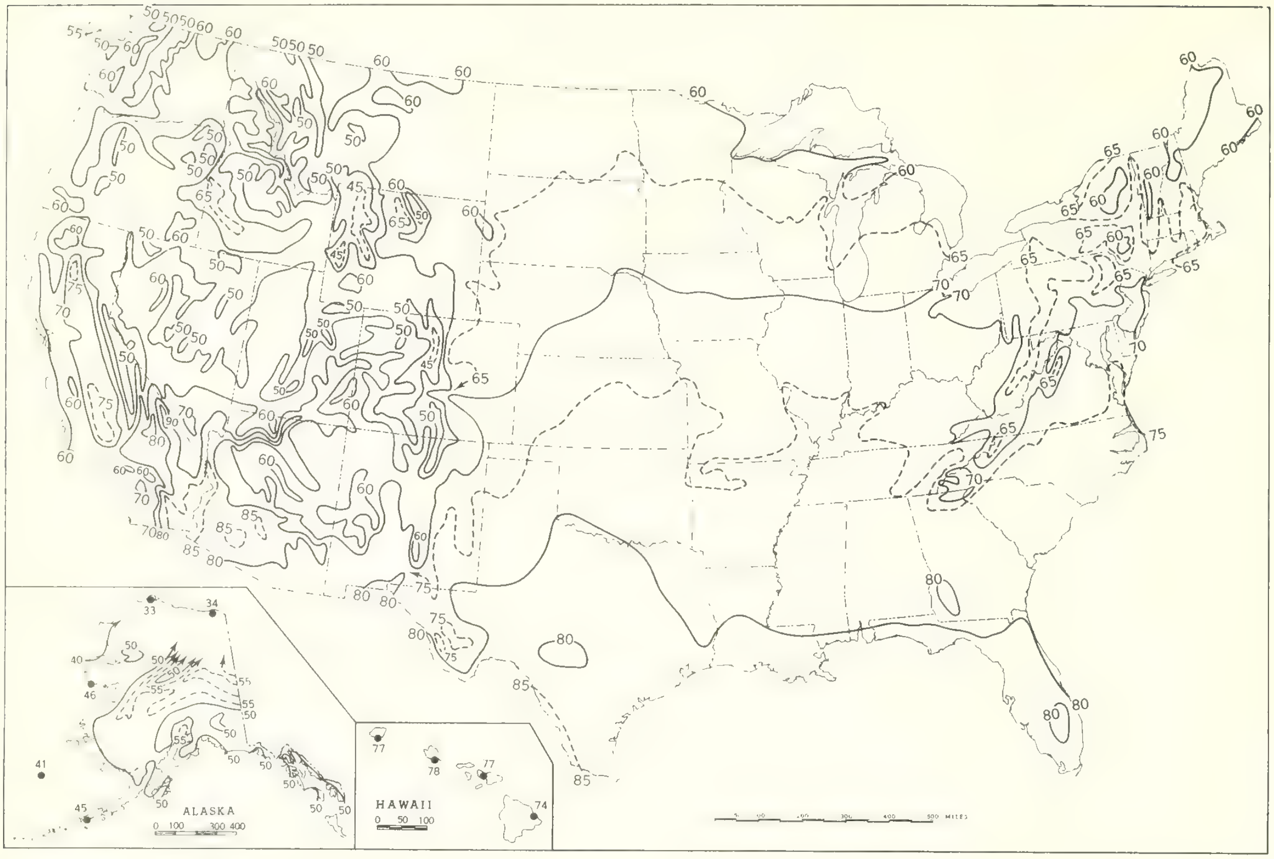
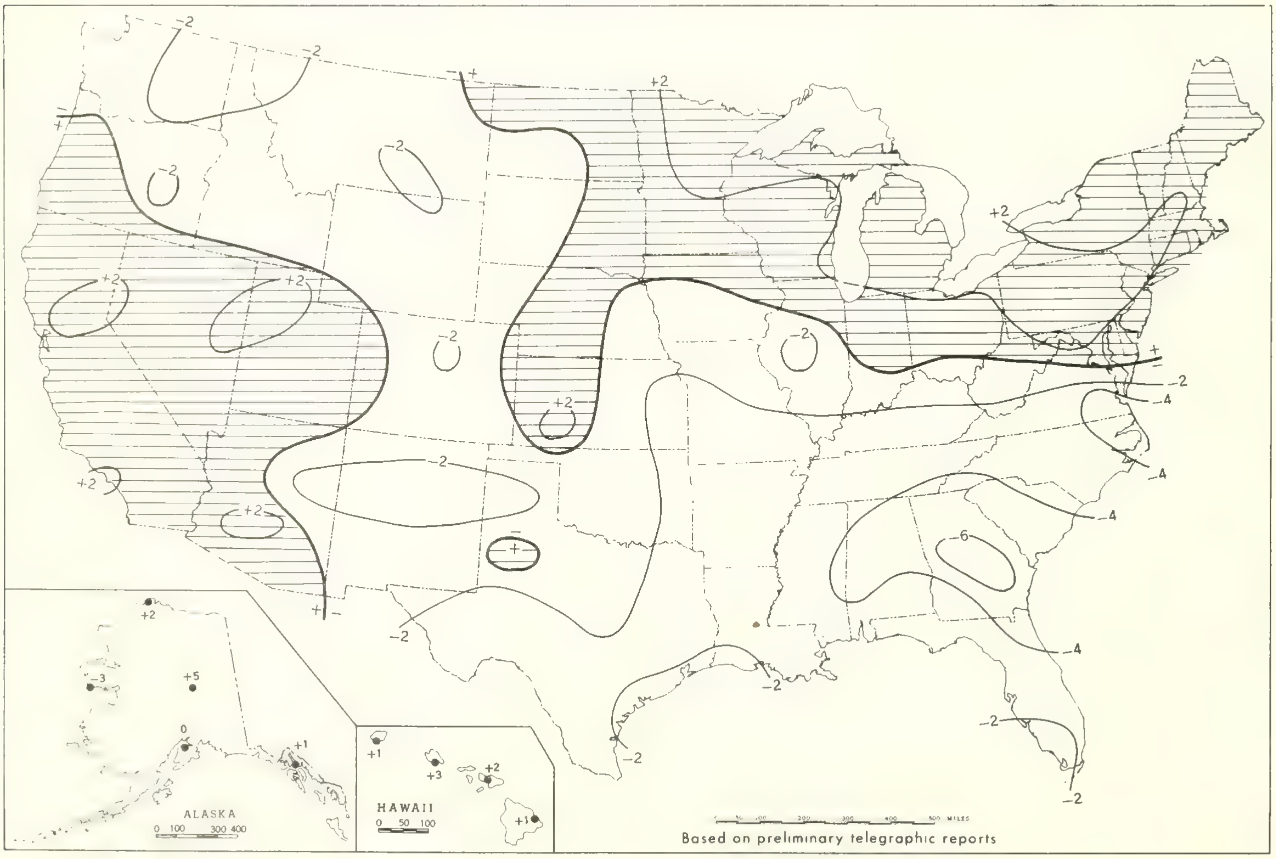
The spectrophotometer measures the total amount of ozone in the atmosphere, i. e., the amount contained in a vertical column of air extending from ground level to the top of the atmosphere in the vicinity of the station. The amount of ozone in this column (coded Ω Ω Ω) is expressed in terms of a thickness of a layer it would occupy at standard temperature and pressure, e. g., 350 milli-atmo-cm ozone implies an ozone layer 0.350 centimeter thick. The code λ s designates the type of measurement made.

Chart 1. A. Normal Daily Average Temperature (°F. 1931-60), June.

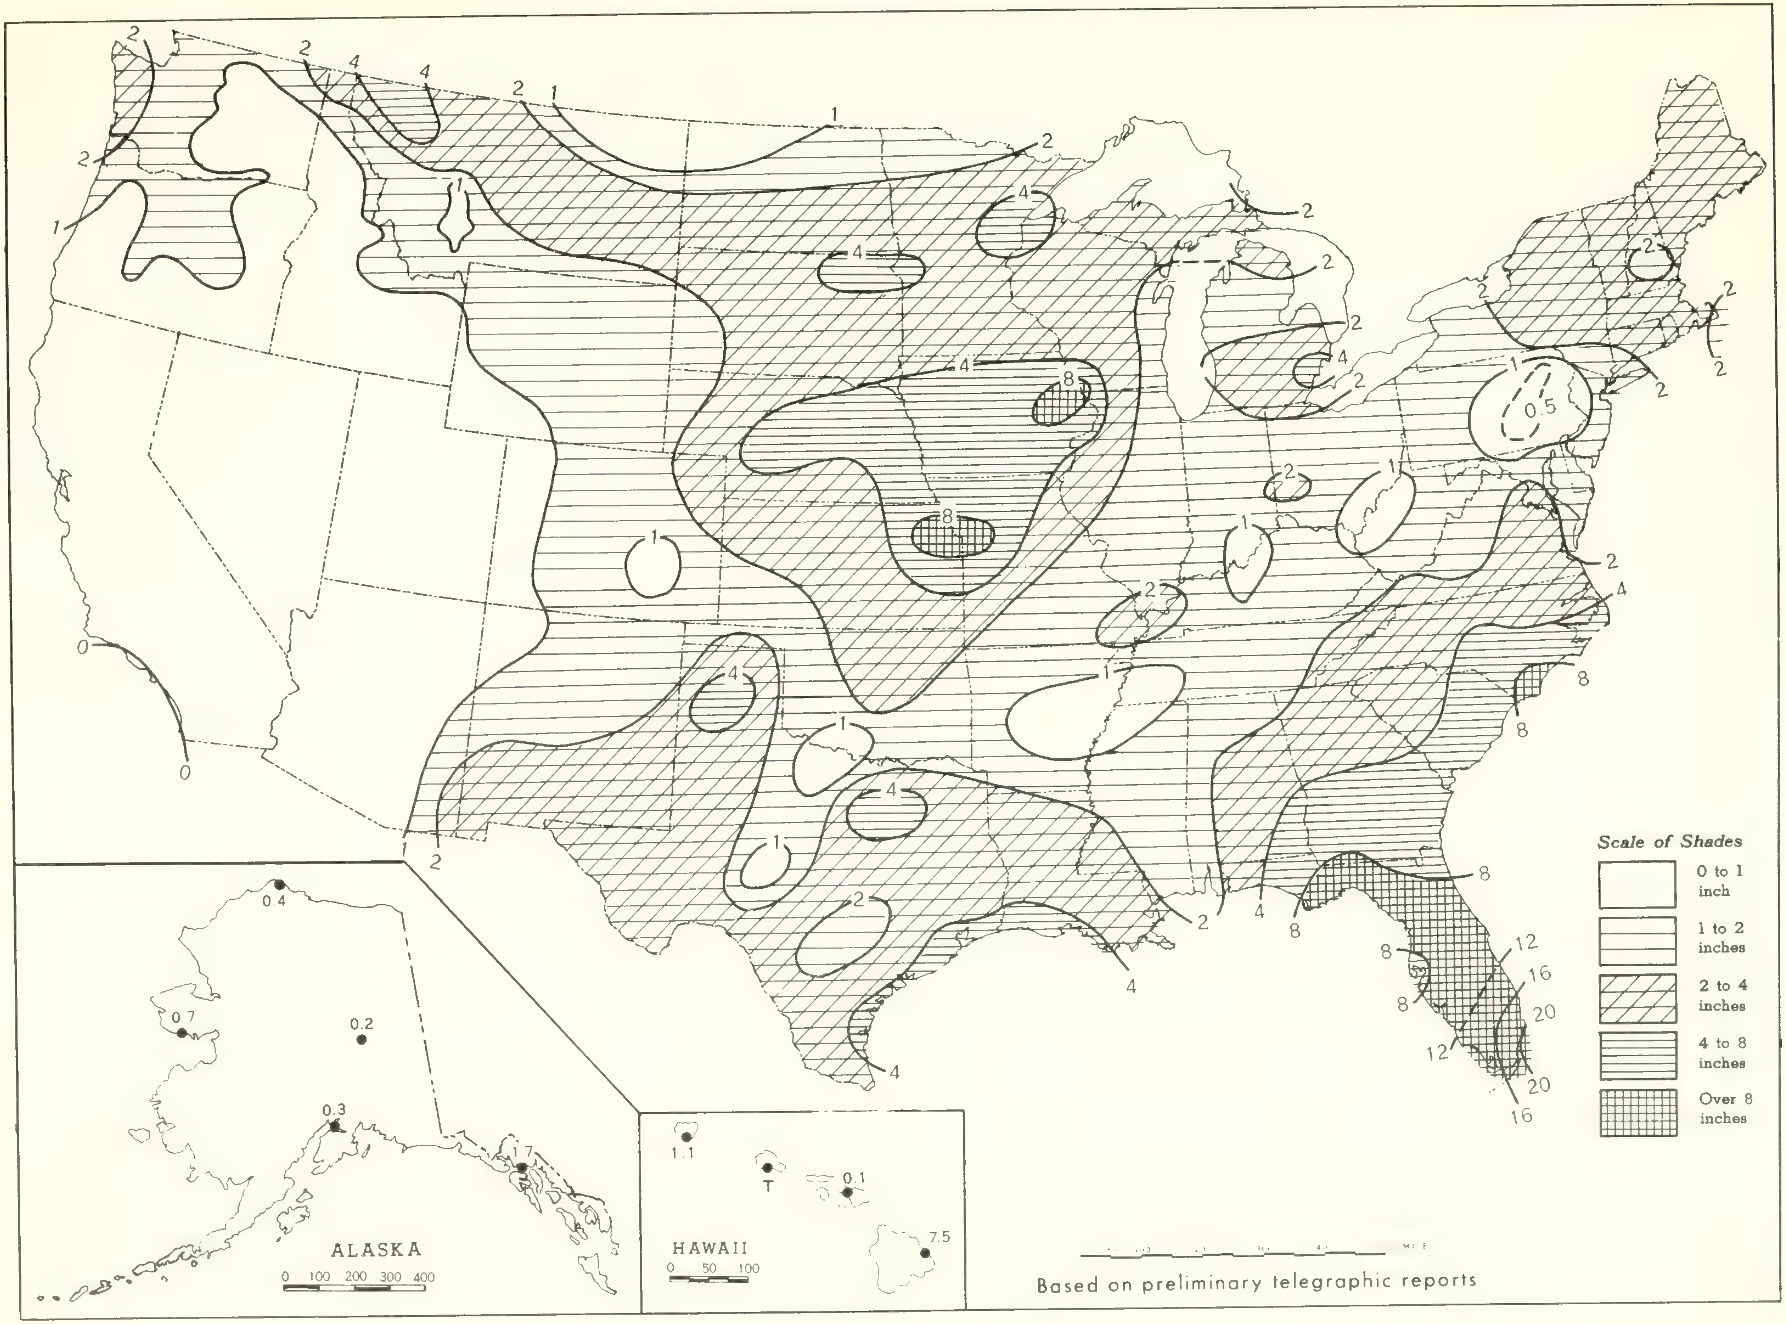


B. Temperature Departure from 30 - Year Mean (°F 1931-60), June 1966.



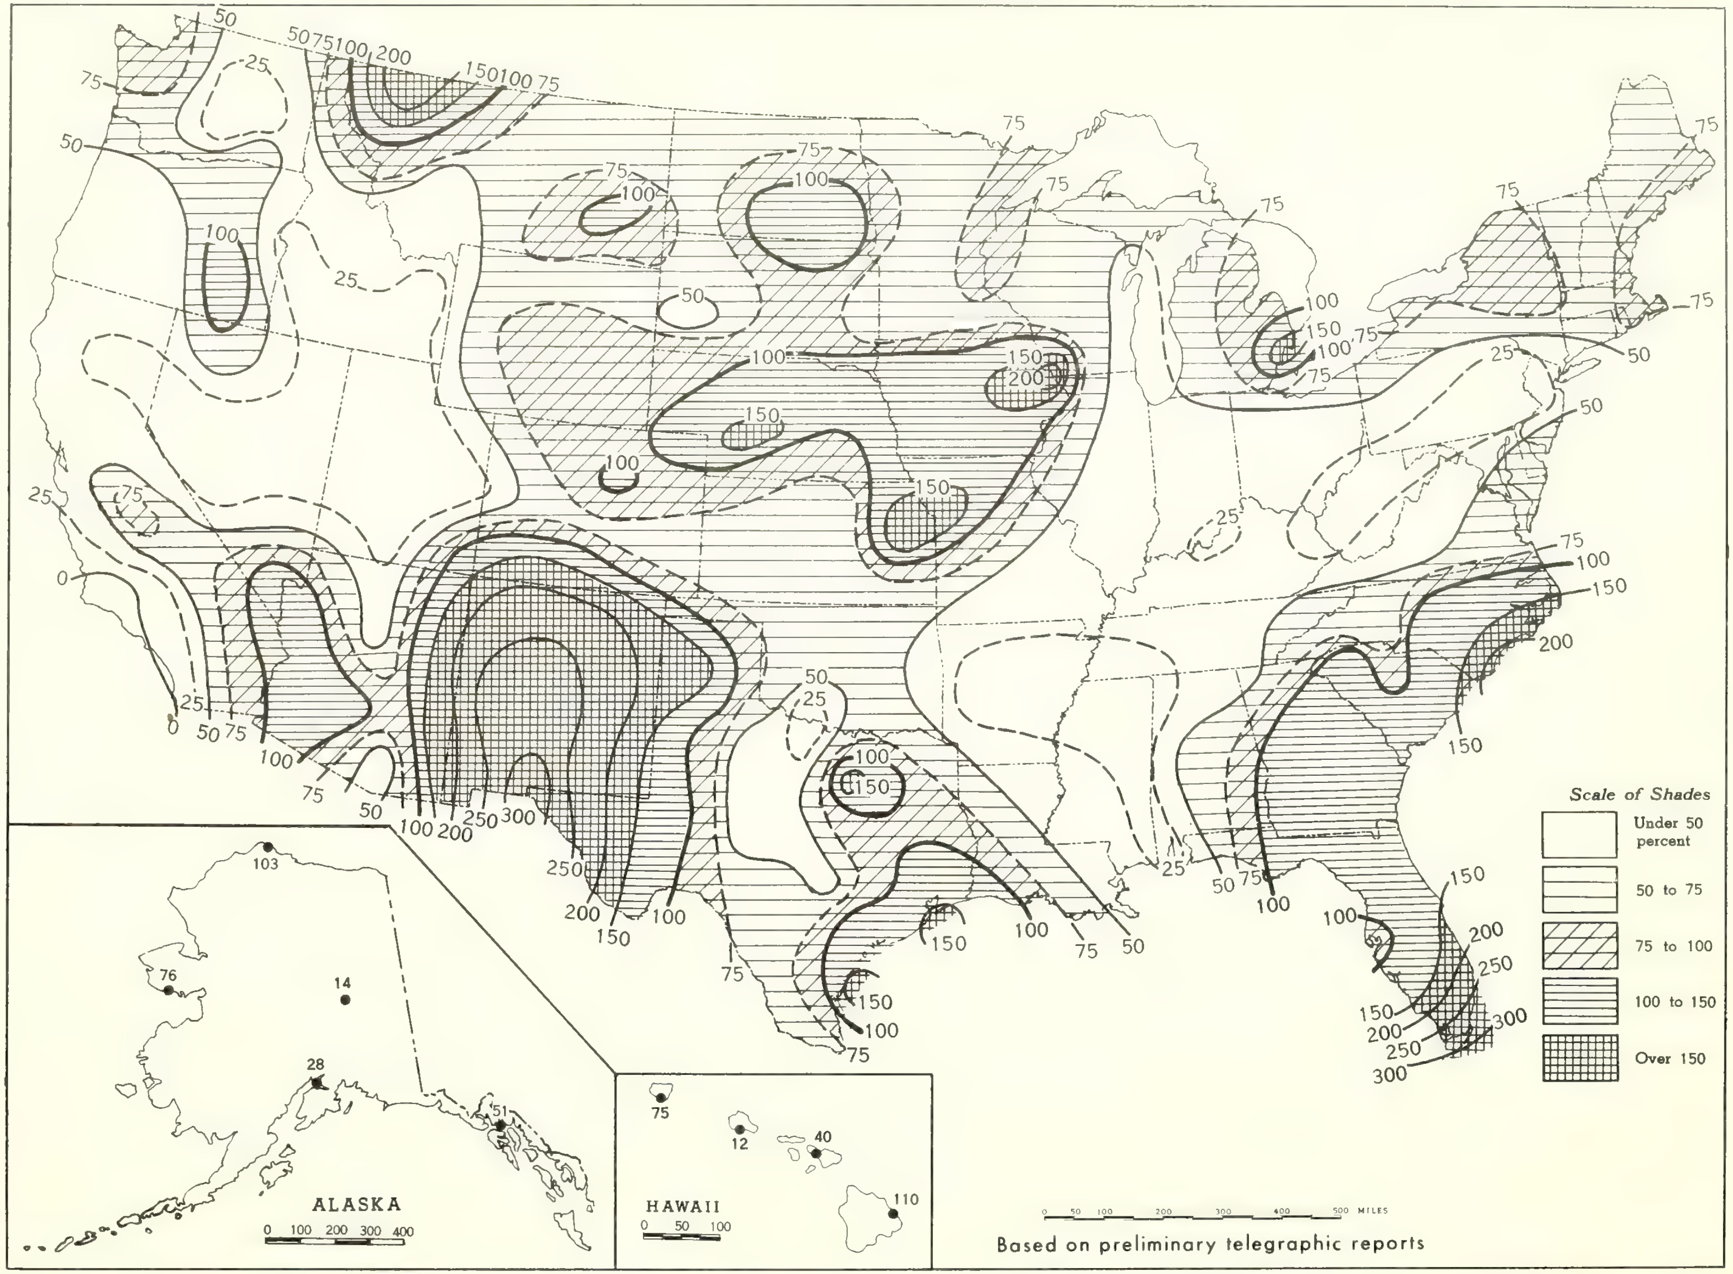
Based on preliminary telegraphic reports

Chart II. Total Precipitation (Inches), June 1966.



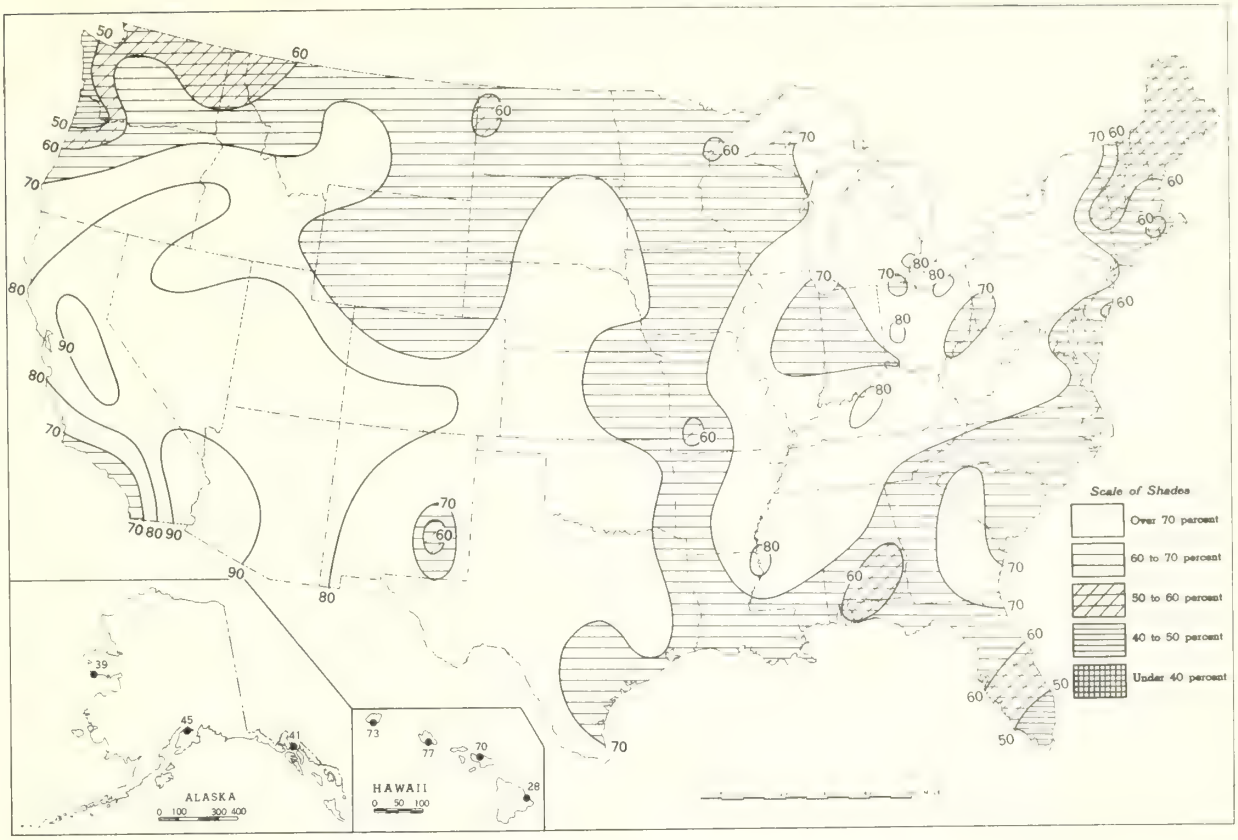
Based on preliminary telegraphic reports

Chart III. Percentage of Normal Precipitation, June 1966.

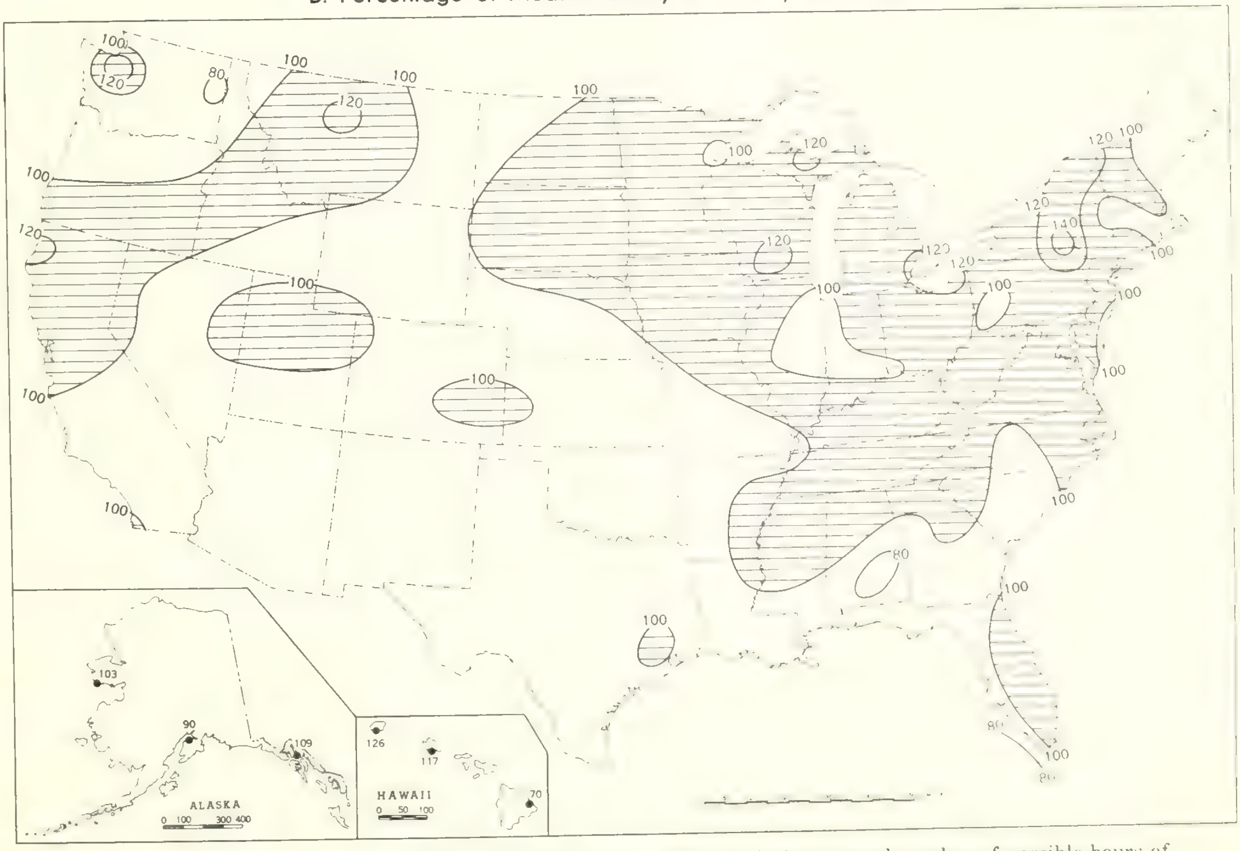


Normal monthly precipitation amounts are computed from 30-yr. normals (1931-60) for first-order Weather Bureau stations.

Chart VI. A. Percentage of Possible Sunshine, June 1966.

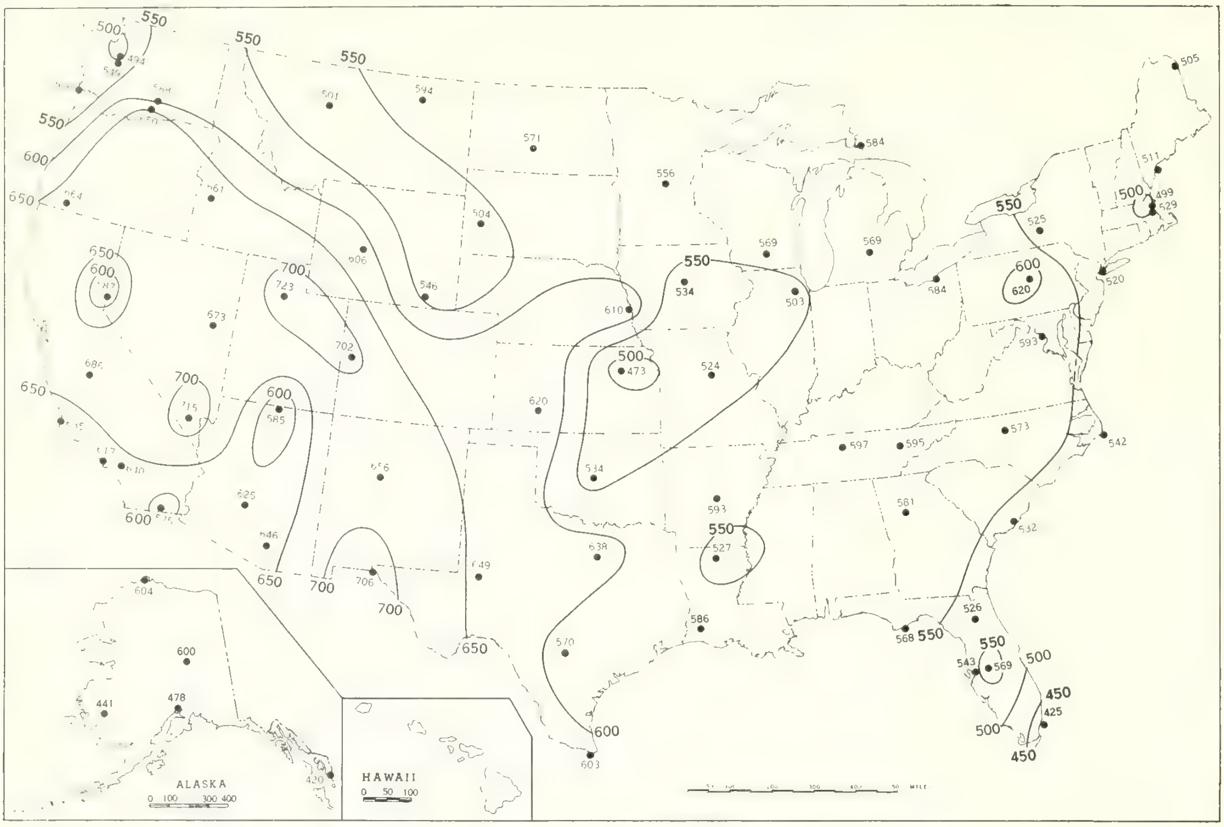


B. Percentage of Mean Monthly Sunshine, June 1966.

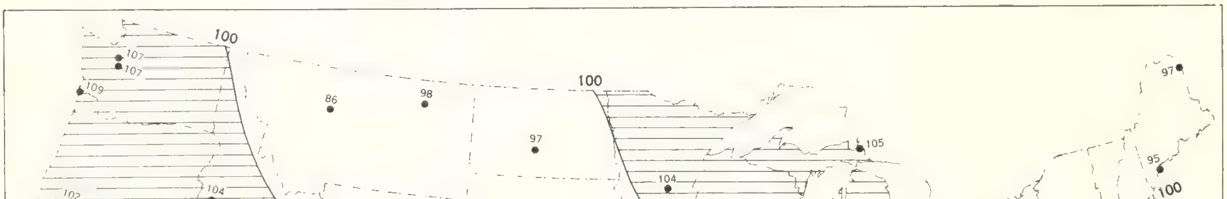


A. Computed from total number of hours of observed sunshine in relation to total number of possible hours of sunshine during month. B. Means are computed for stations having at least 10 years of record.

Chart VII. A. Average Daily Values of Solar Radiation, Langleys, June 1966.

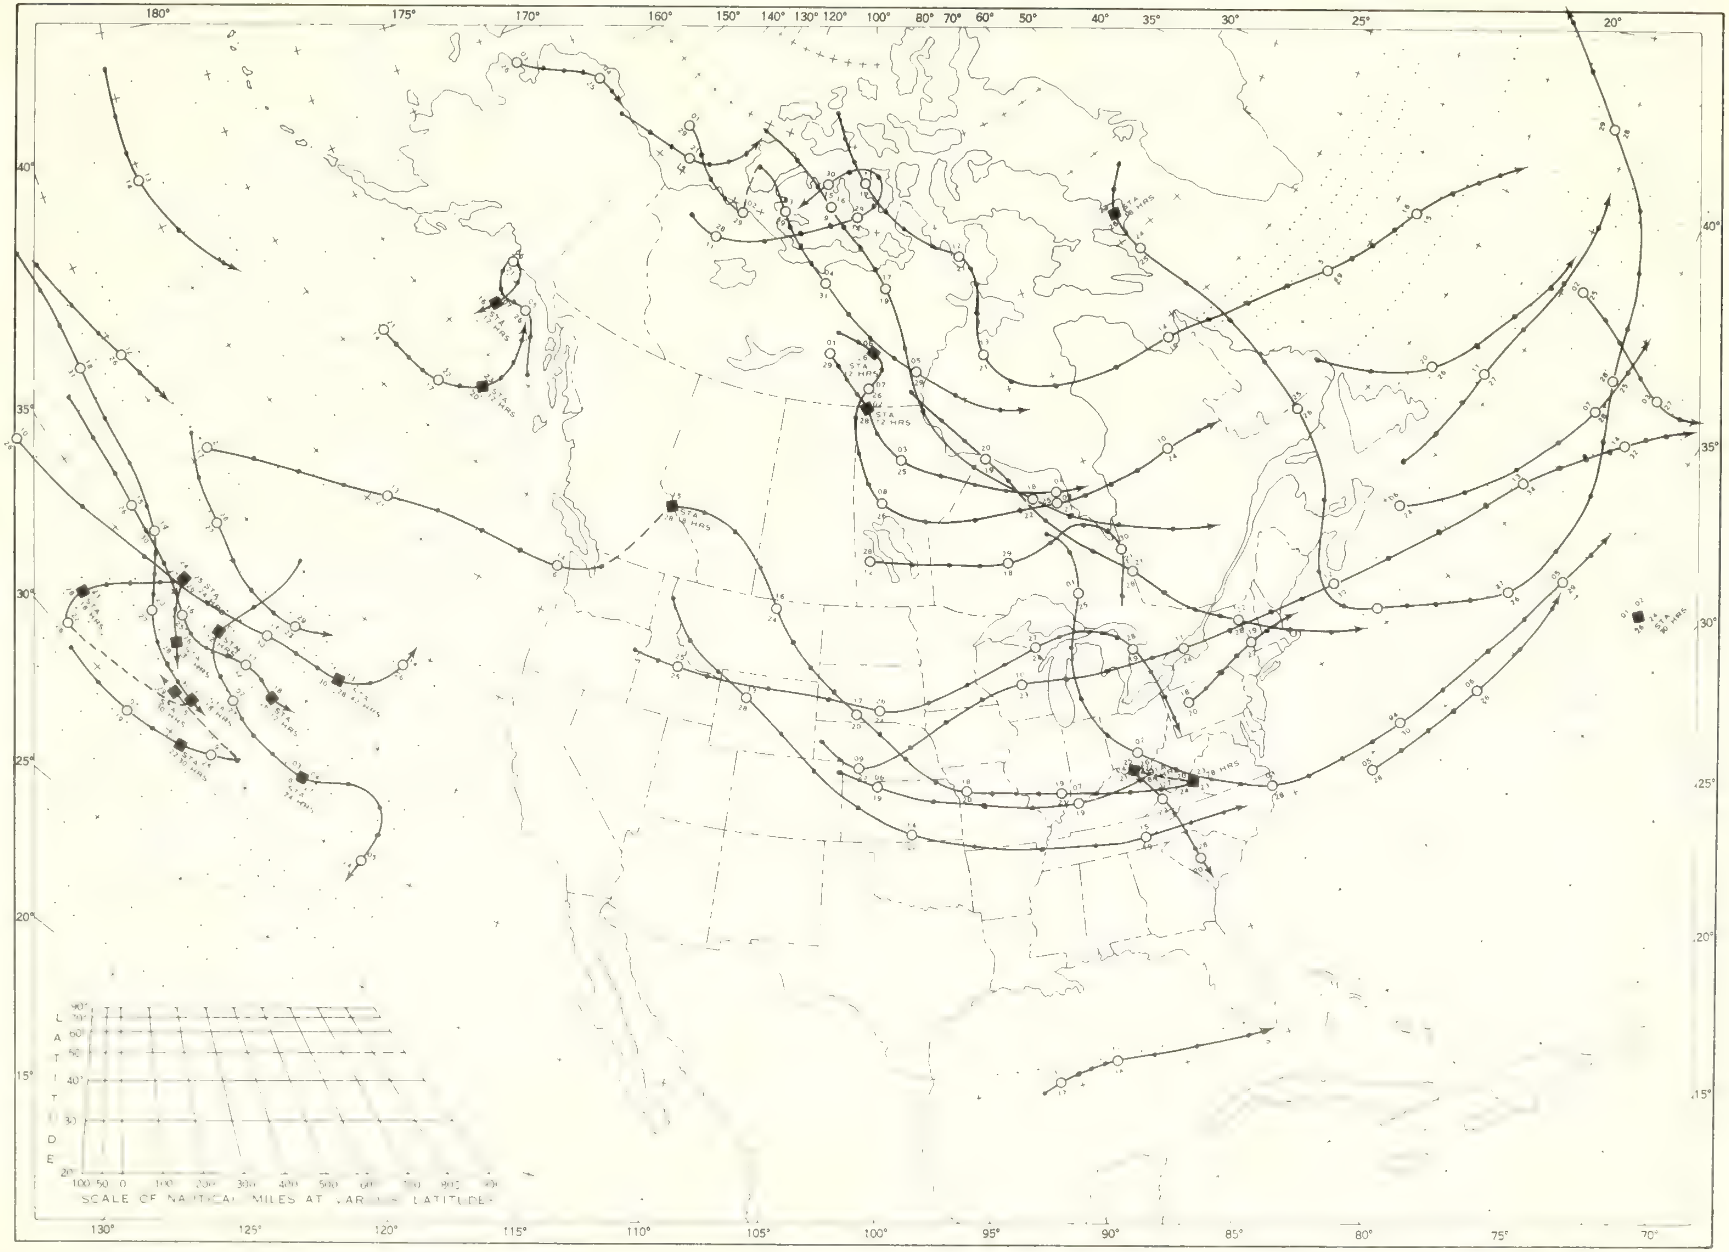


B. Percentage of Mean Daily Solar Radiation, June 1966.



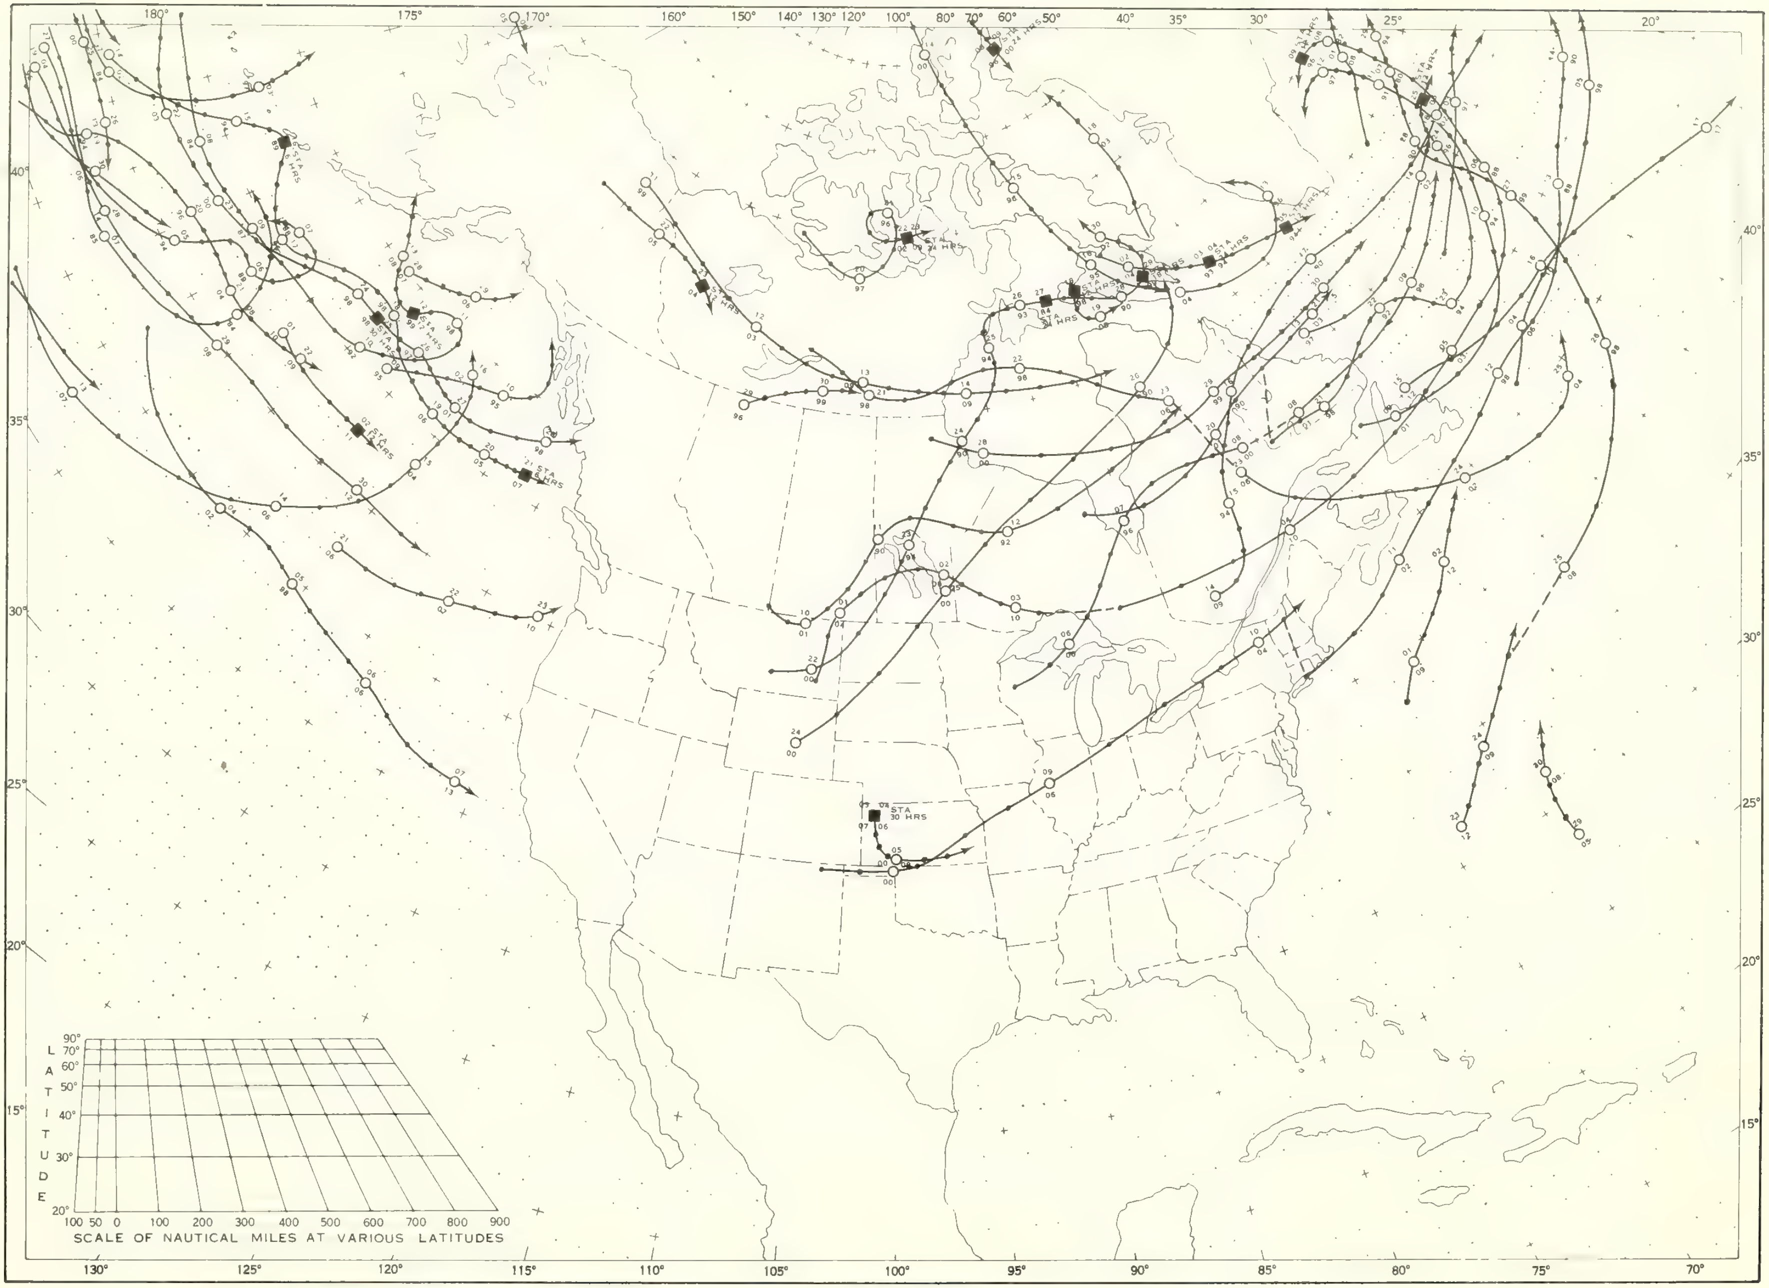
A. Mean daily solar radiation, direct + diffuse, received on a horizontal surface in langleys (1 langley = 1 gm. cal. cm. $^{-2}$) and recorded in International Pyrheliometer Scale of 1956. B. Percentage of the mean based on at least 5 years of record during the period 1950-60, and corrected to the International Pyrheliometer Scale of 1956.

Chart VIII. Tracks of Centers of Anticyclones at Sea Level, June 1966.



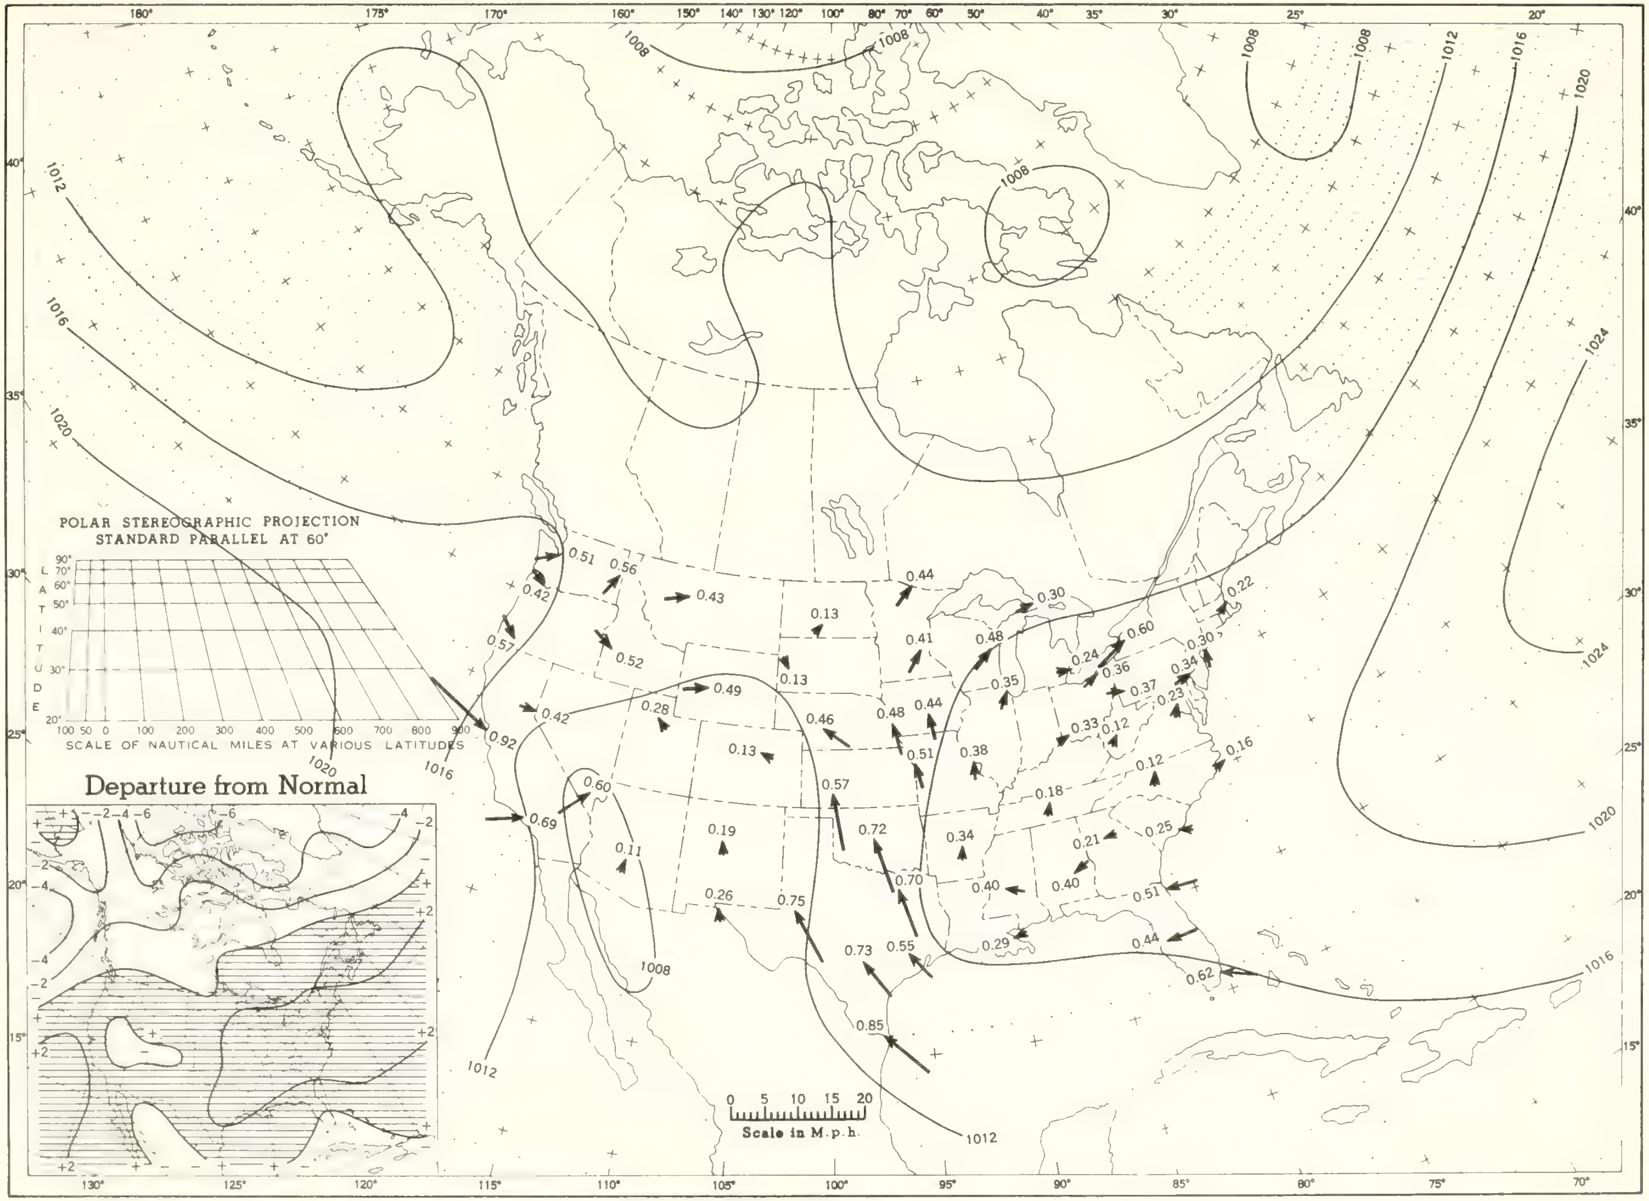
Circle indicates position of center at 7:00 a. m. E. S. T. Figure above circle indicates date, figure below, pressure to nearest millibar. Dots indicate intervening 6-hourly positions. Squares indicate position of stationary center for period shown. Dashed line in track indicates reformation at new position. Only those centers which could be identified for 24 hours or more are included.

Chart IX. Tracks of Centers of Cyclones at Sea Level, June 1966.



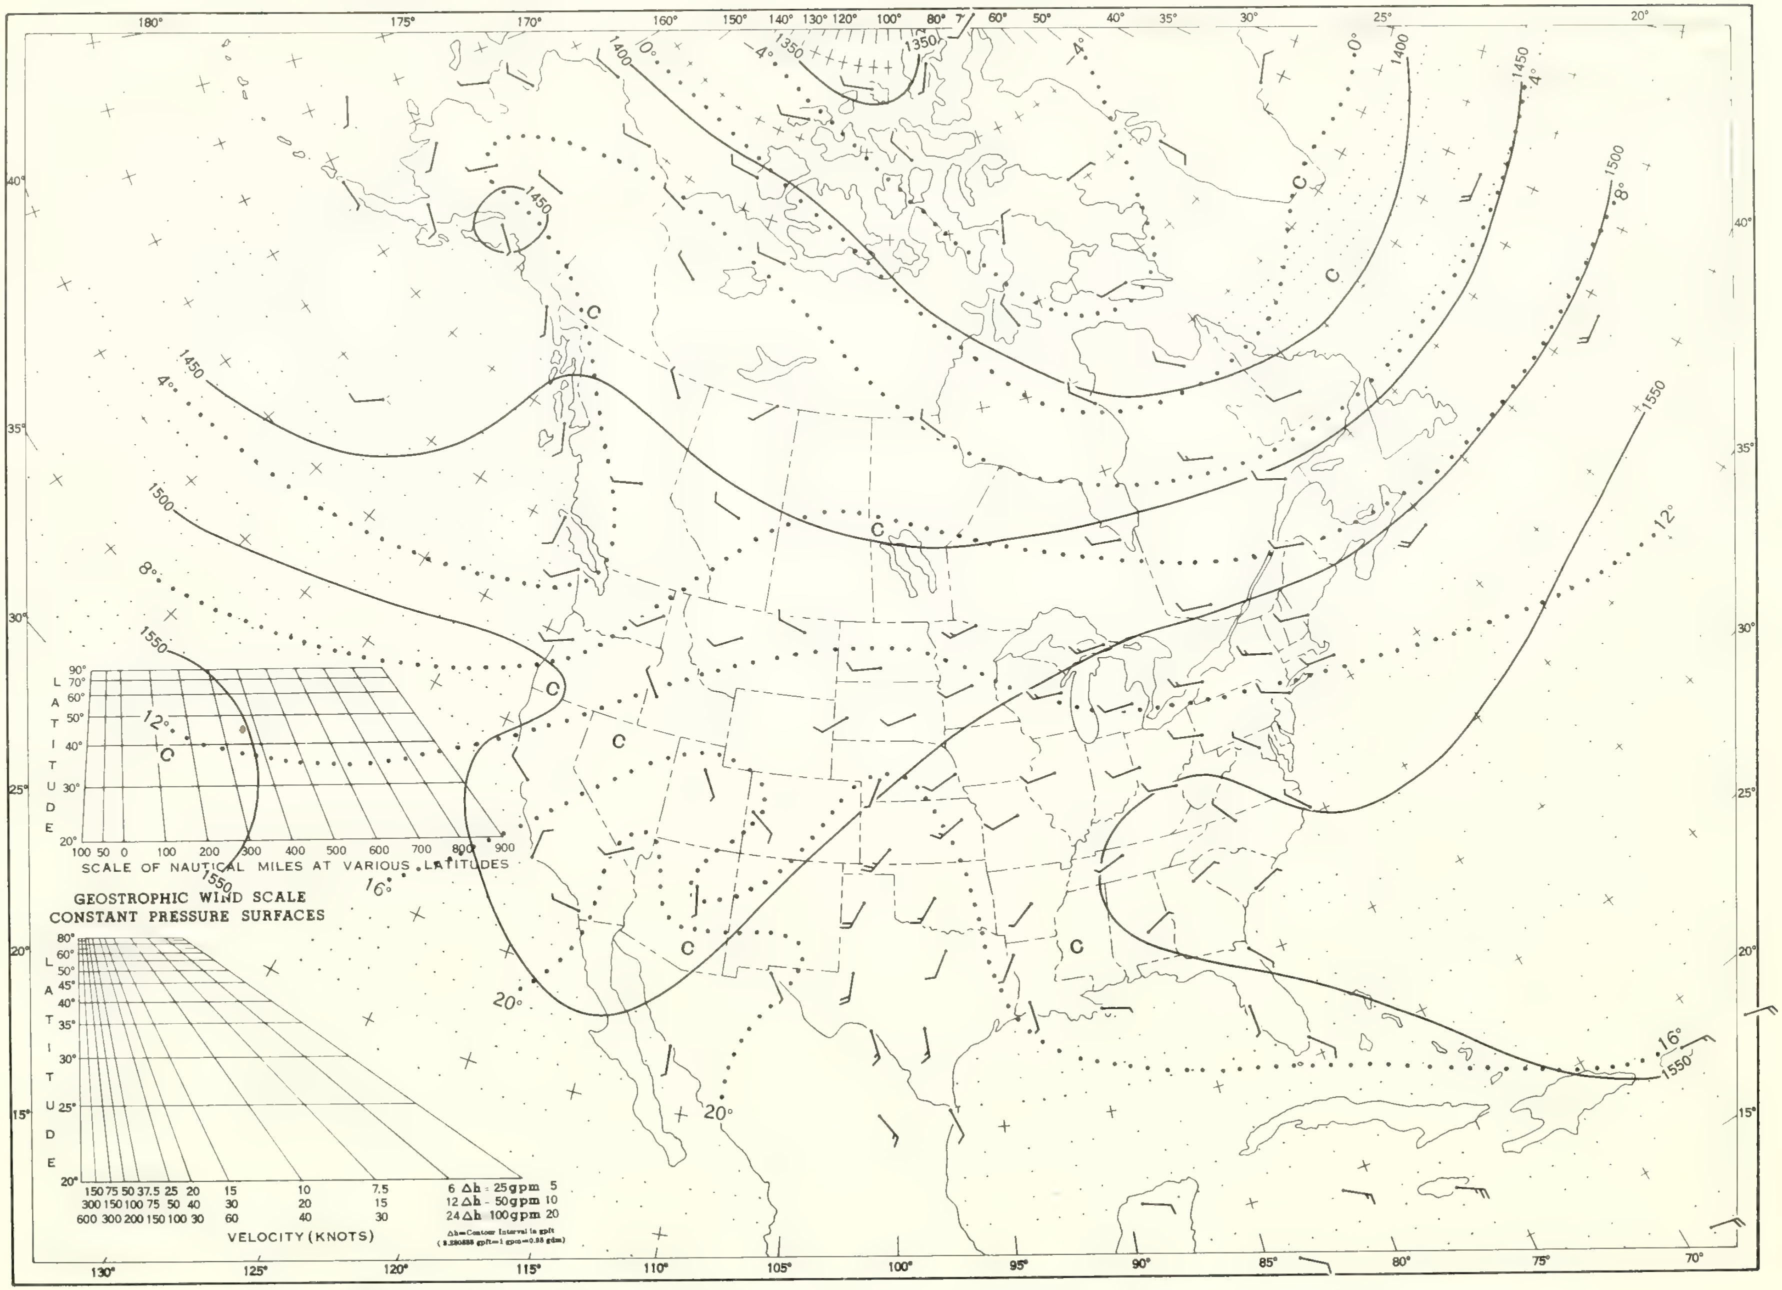
Circle indicates position of center at 7:00 a. m. E. S. T. See Chart VIII for explanation of symbols.

Chart X. Average Sea Level Pressure (mb) and Resultant Surface Wind, June 1966. Inset: Departure of Average Pressure (mb) from Normal, June 1966.



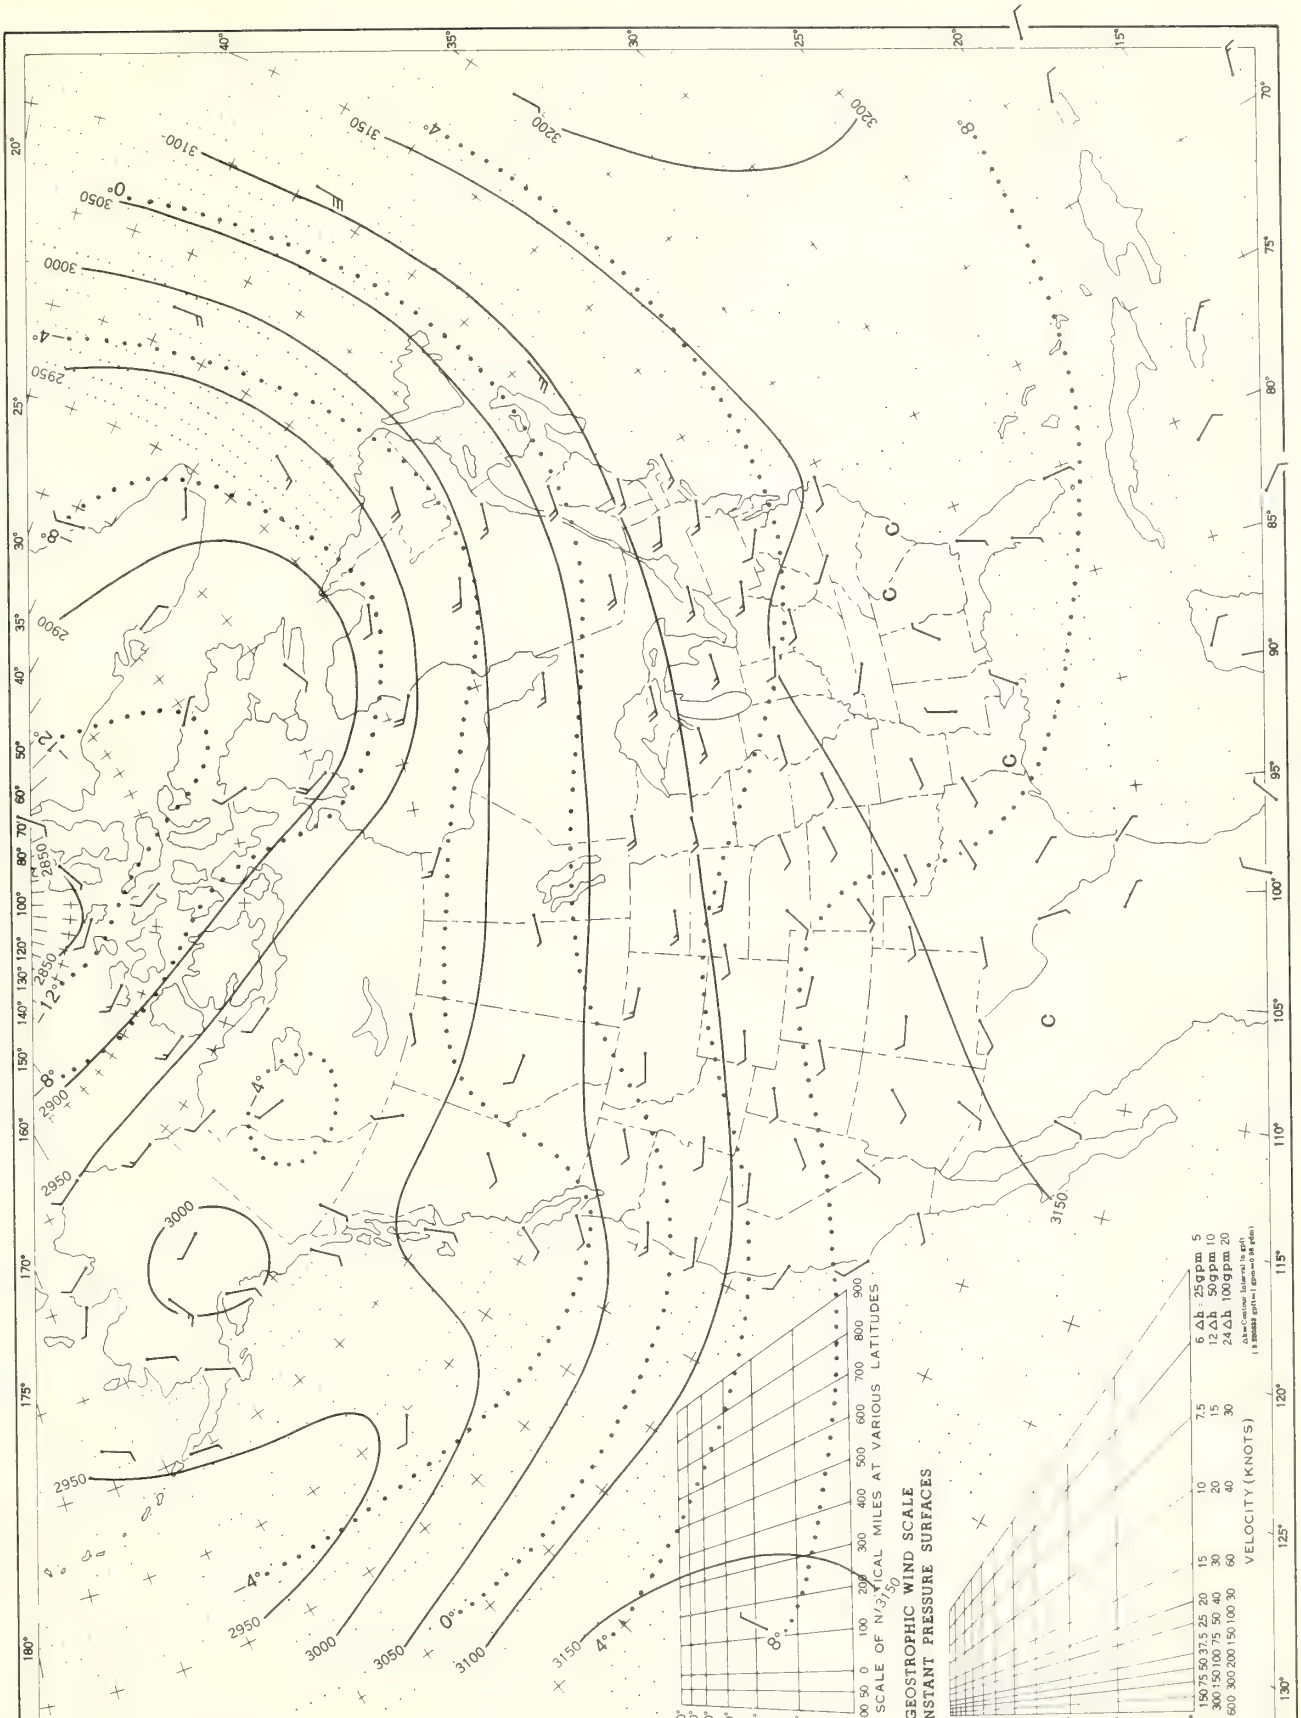
Average sea level pressures are obtained from eight daily 3-hourly observations. Resultant wind directions and speeds are shown by arrows. Constancy ratios (resultant speed÷average speed) are shown to two decimal places. Pressure normals are computed for stations having at least 10 years of record and for 10° intersections in a diamond grid over the oceans.

Chart XI. 850-mb. Surface, 1200 GMT, June 1966. Average Height and Temperature, and Resultant Winds.



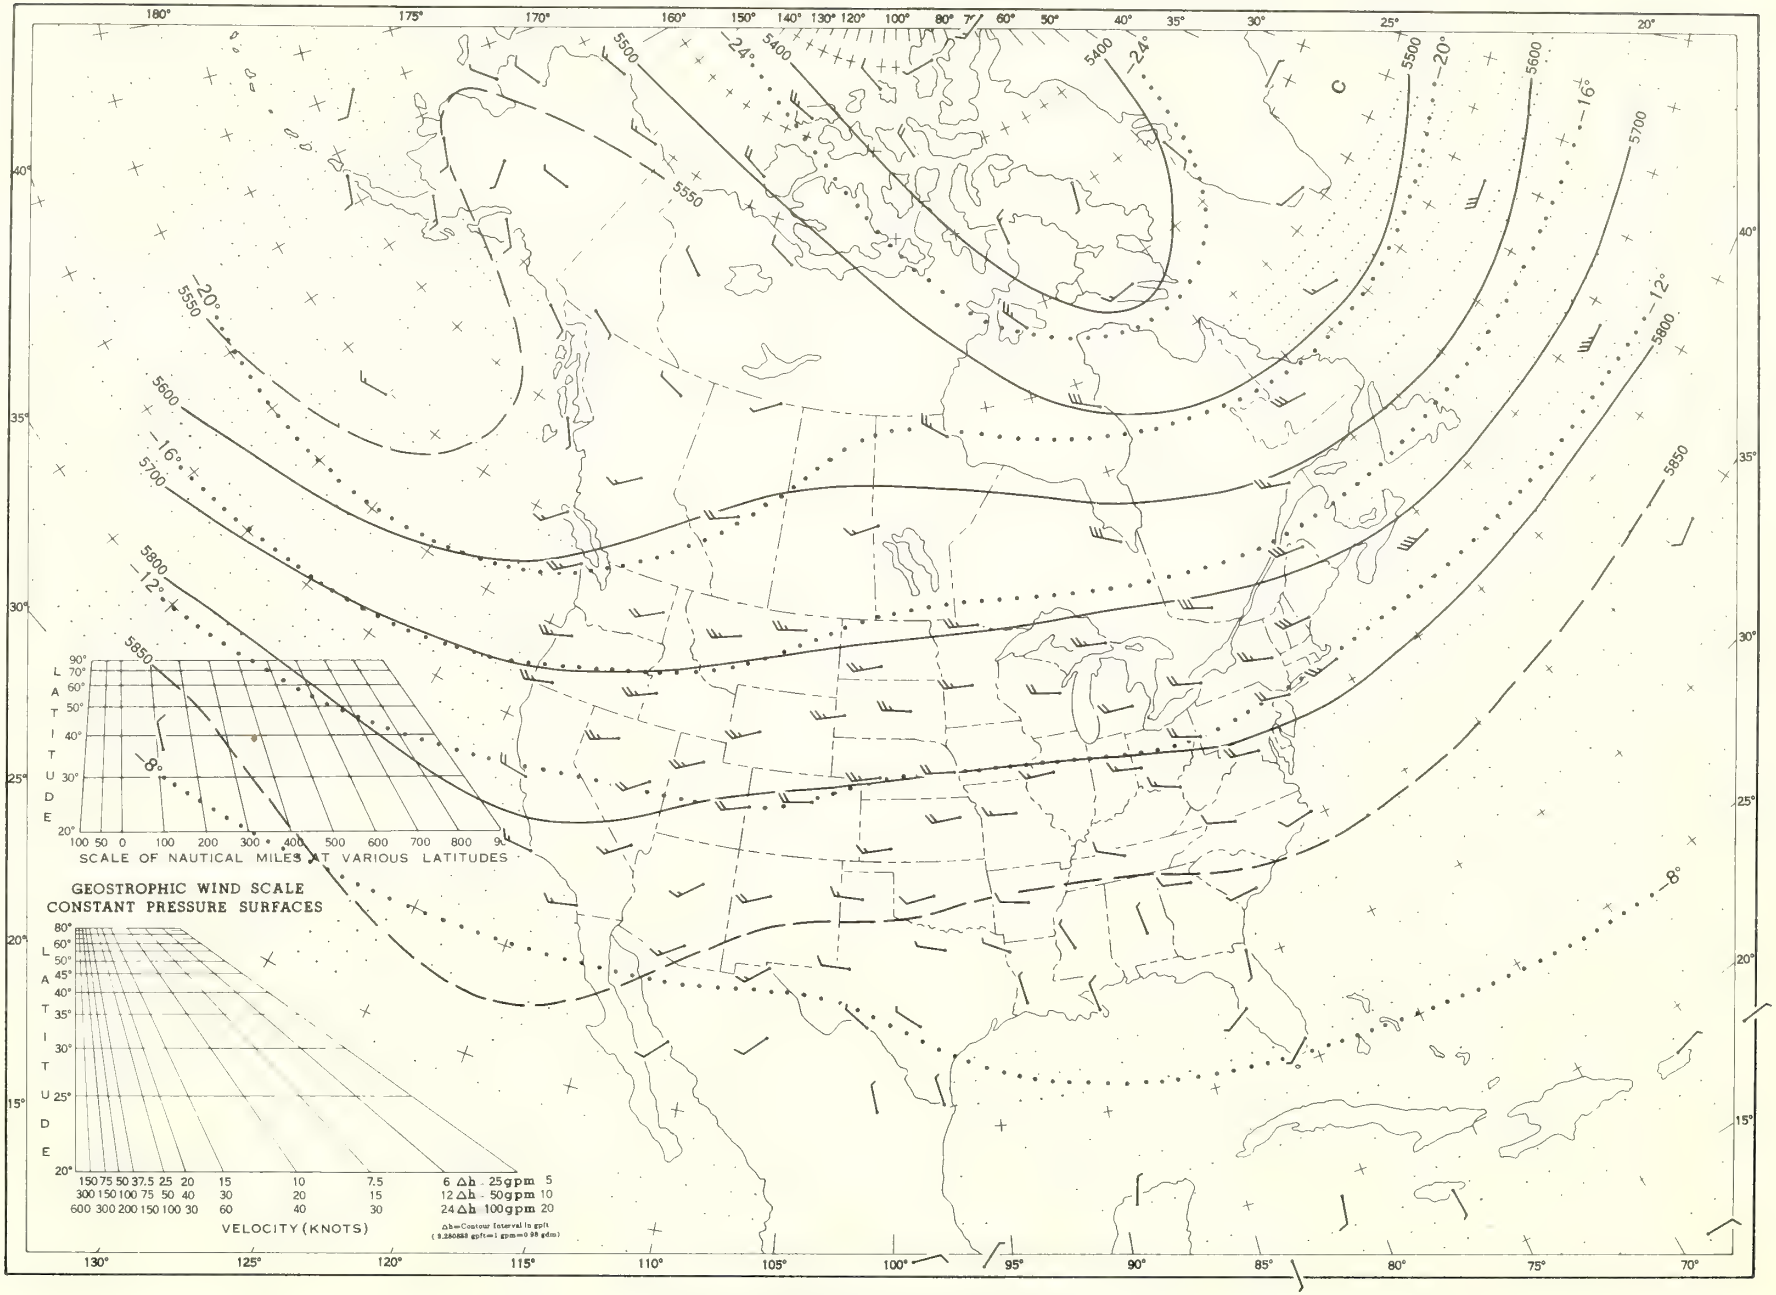
Height in geopotential meters (1 g.p.m. = 0.98 dynamic meters). Temperature in °C. Wind speed in knots; flag represents 50 knots, full feather 10 knots, and half feather 5 knots. All wind data are based on rawin observations.

Chart XII. 700-mb. Surface, 1200 GMT, June 1966. Average Height and Temperature, and Resultant Winds.



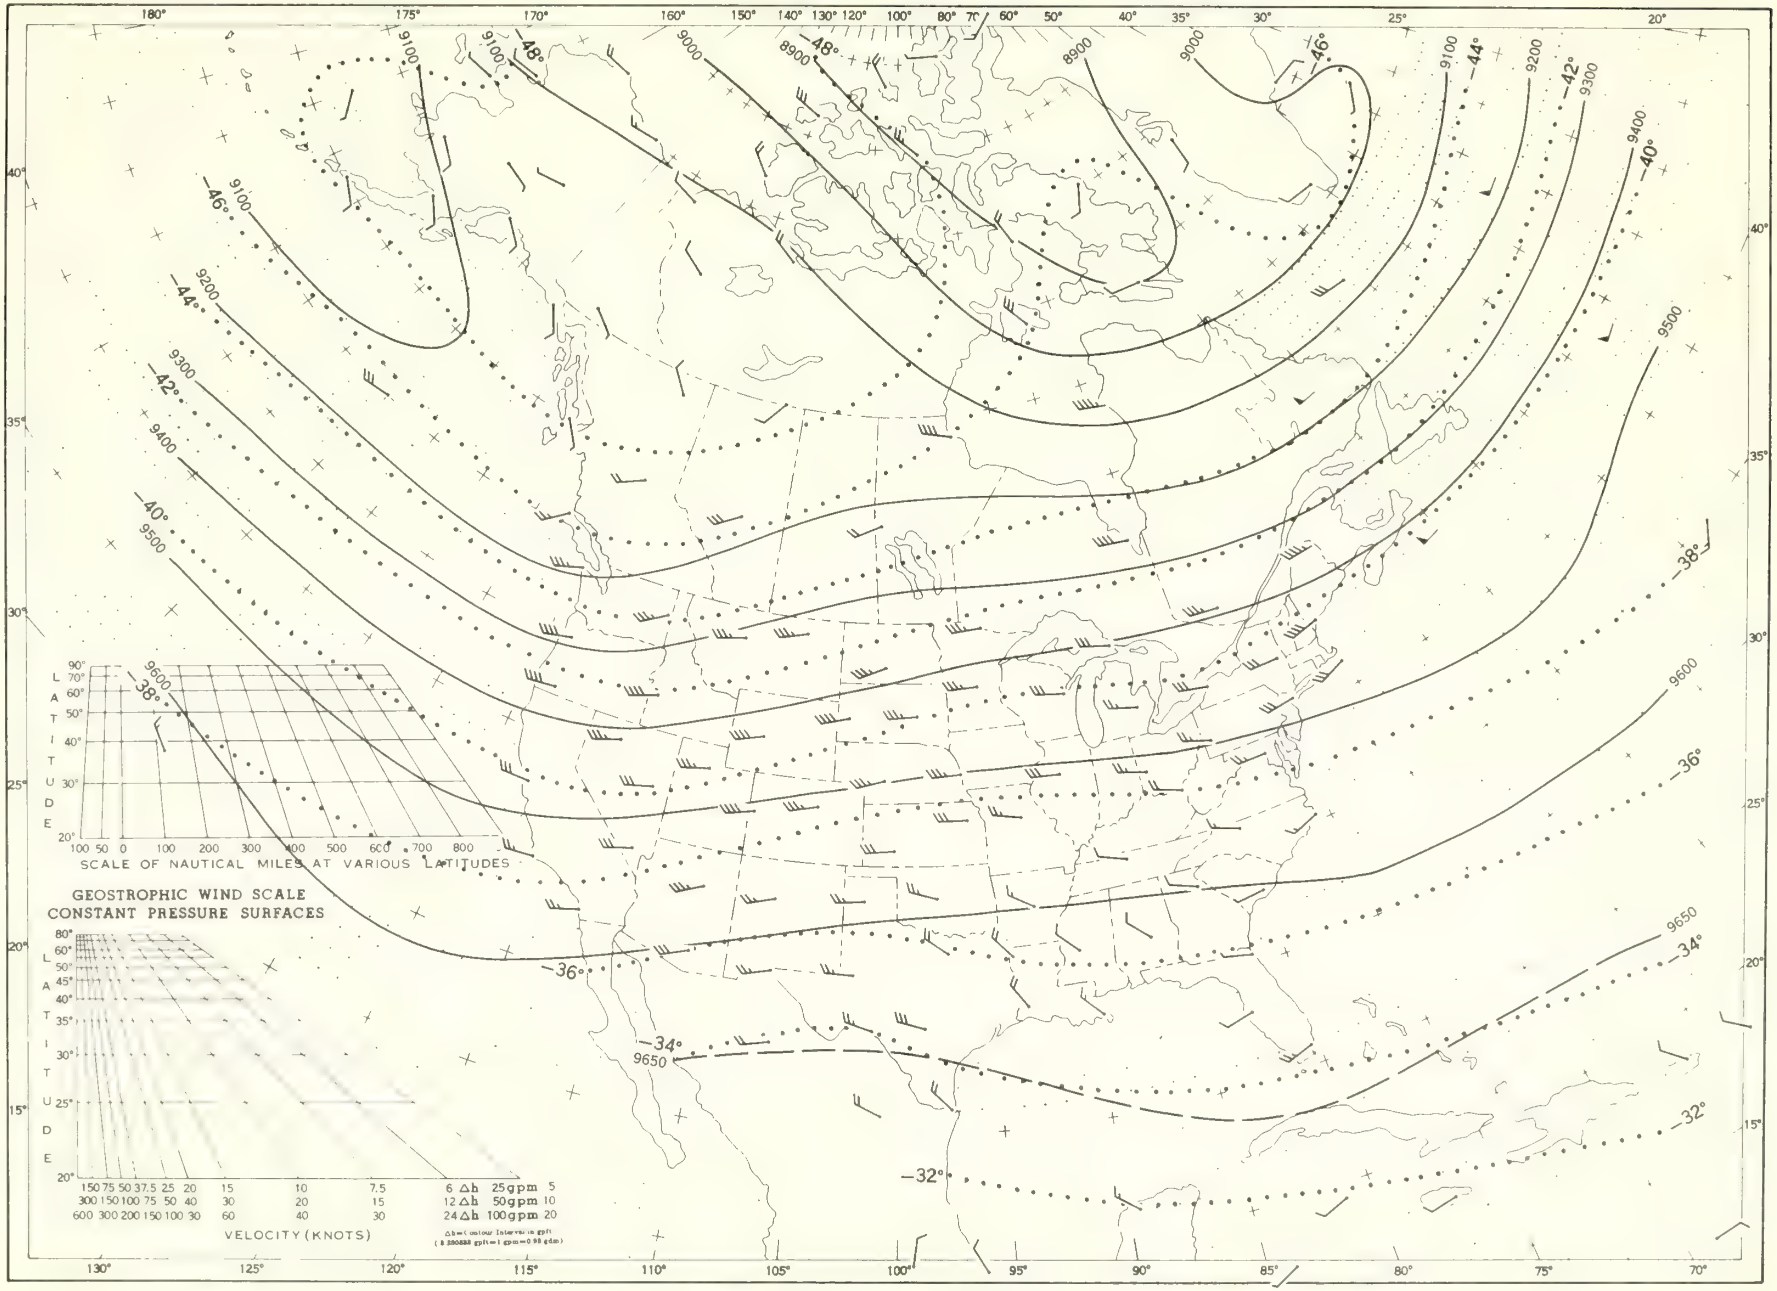
See Chart XI for explanation of map.

Chart XIII. 500-mb. Surface, 1200 GMT, June 1966. Average Height and Temperature, and Resultant Winds.



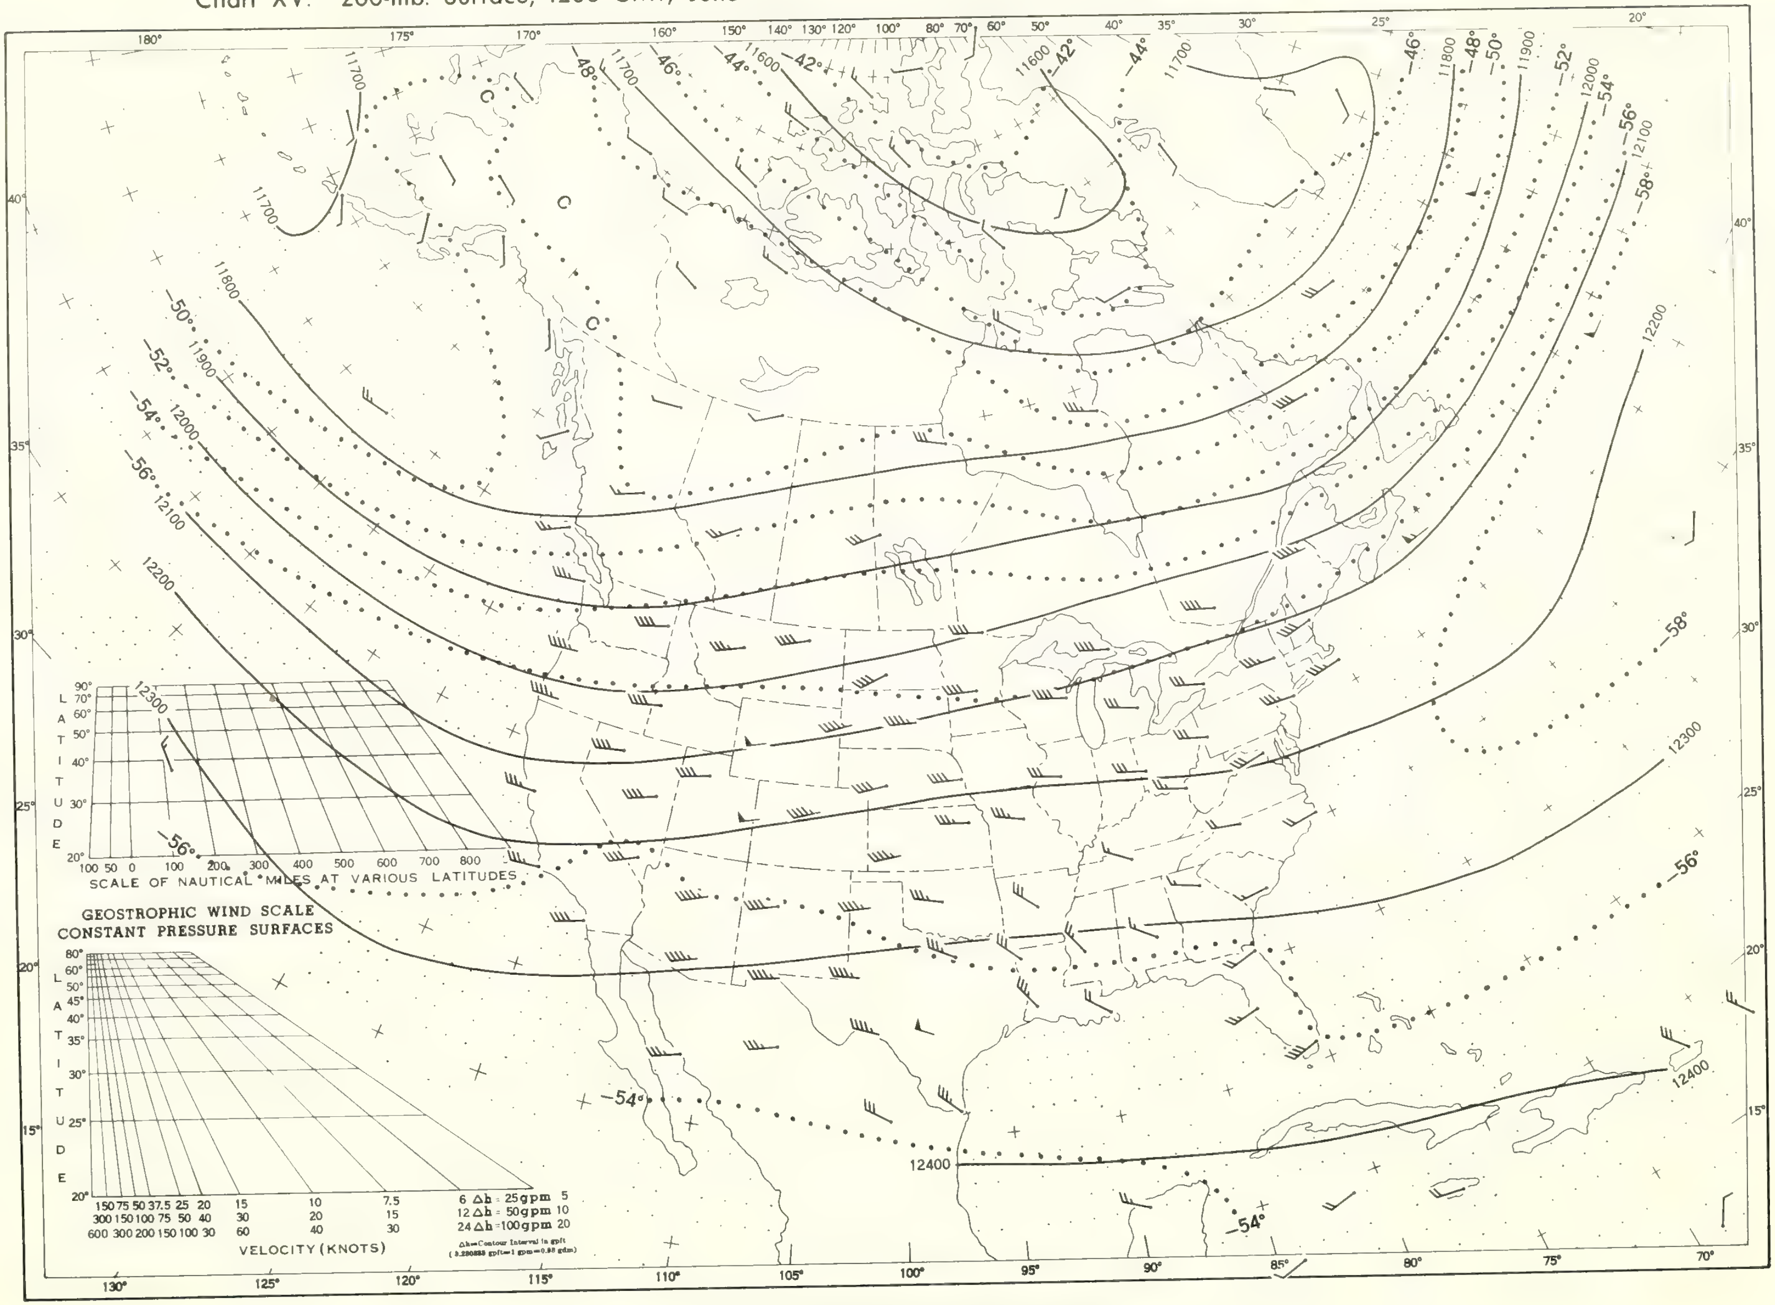
See Chart XI for explanation of map.

Chart XIV. 300-mb. Surface, 1200 GMT, June 1966. Average Height and Temperature, and Resultant Winds.



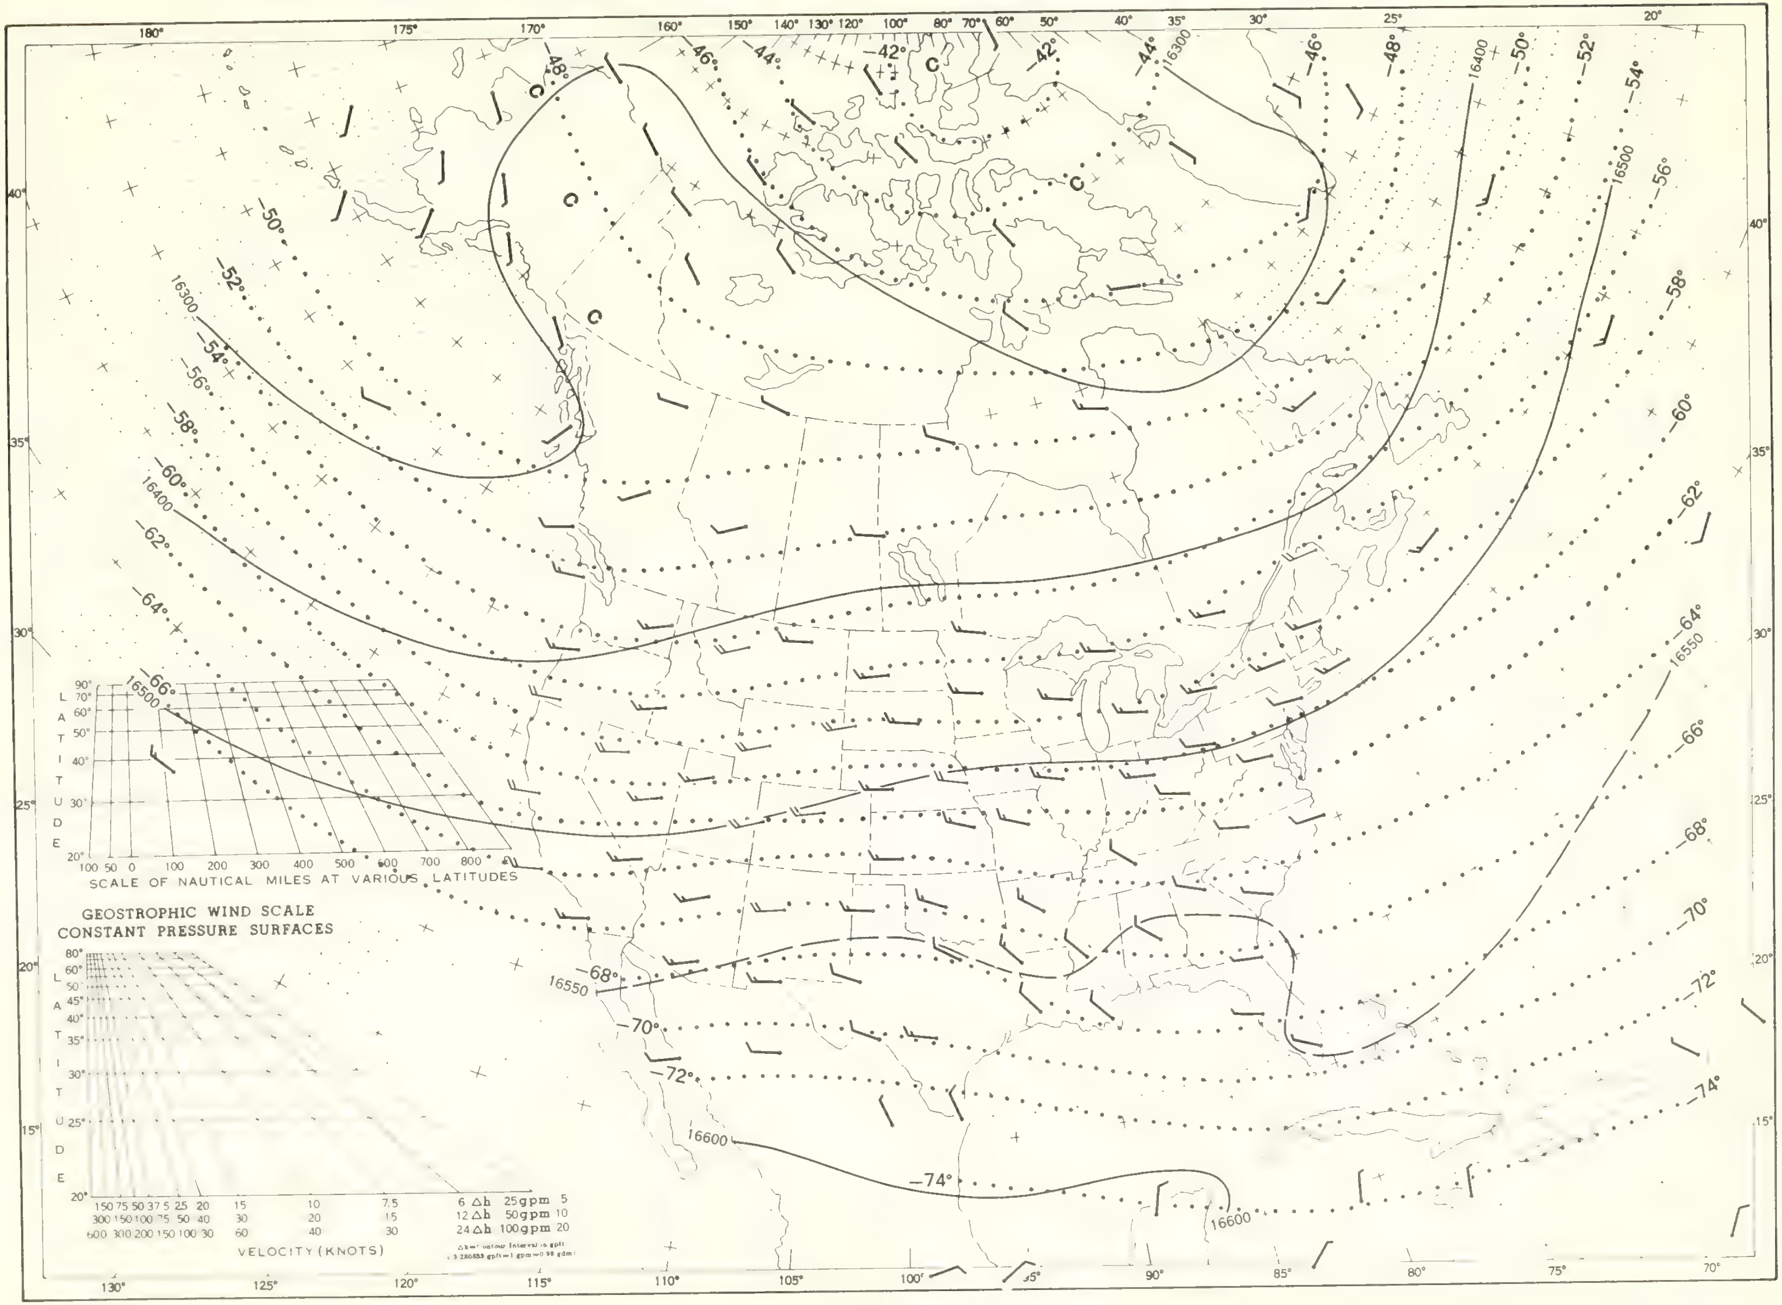
See Chart XI for explanation of map.

Chart XV. 200-mb. Surface, 1200 GMT, June 1966. Average Height and Temperature, and Resultant Winds.



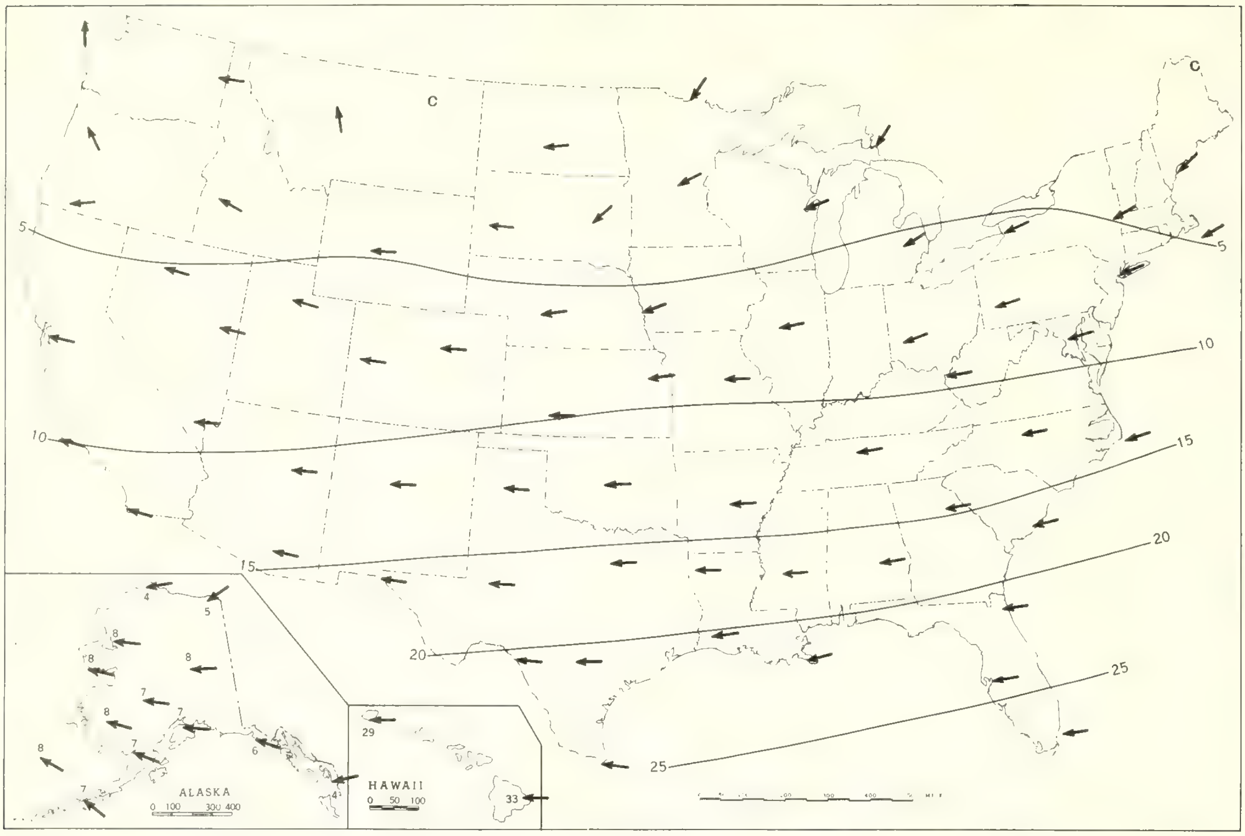
See Chart XI for explanation of map.

Chart XVI. 100-mb. Surface, 1200 GMT, June 1966. Average Height and Temperature, and Resultant Winds.

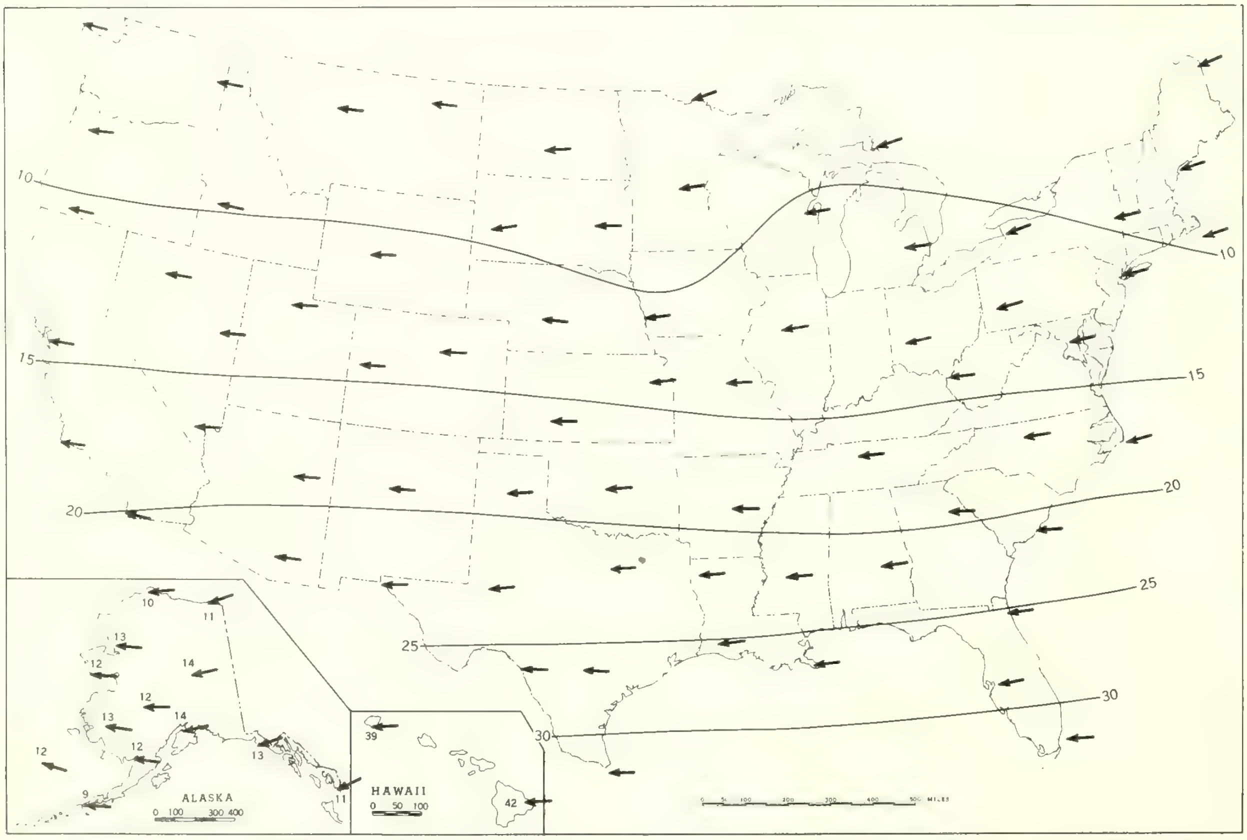


See Chart XI for explanation of map.

Chart XVII. A. 50-mb. Surface, 1200 GMT, June 1966. Resultant Winds.



B. 30-mb. Surface, 1200 GMT, June 1966. Resultant Winds.



Wind speed (isotachs) in knots. Arrows show resultant wind direction. All wind data are based on rawin observations.

CLIMATOLOGICAL DATA

NATIONAL SUMMARY

Volume 17 No. 7 JULY 1966

GENERAL SUMMARY OF WEATHER CONDITIONS

HIGHLIGHTS:

1. Heat Wave in Northeast and Midcontinent.

2. Northeastern drought continued.

3. Record rainfall north Pacific coast.

TEMPERATURE.--Temperatures were featured by a heat wave that began in the northeast quarter of the Country in June and spread southward to the Gulf and westward over the Rockies during the first half of July. In the Northeast temperatures reached 100° or higher on as many as 5 days at some stations. Highest temperatures in the Northeast generally occurred on the 3d when Harrisburg, Pa., and La Guardia Field, N. Y., reported 107°, alltime records for both locations and for the New York City area.

In midcontinent areas temperatures rose to near record levels for July, and the number of days with temperatures above either 90° or 100° was among the greatest of record. Wichita Falls, Tex., recorded 100° or higher on 24 days, Huron, S. Dak., on 6 and Springfield, Ill., and Memphis, Tenn., on 8. High humidity added to the discomfort of the heat wave in the northern Great Plains, upper Mississippi Valley, and upper Great Lakes.

The heat wave was centered over the middle Mississippi Valley and east-central Great Plains where average temperatures for the first half of the month ranged from 6° to 9° above normal. At St. Louis, Mo., the 6-day period (9-14th) with maxima over 100° was the longest such period since the summer of 1953, and the low of 84° for the night of the 11-12th was the highest minimum since the memorable July of 1936 when a low of 87° was recorded on the 14th. The hot, dry weather burned pastures and slowed growth of spring-planted crops. High temperatures and hot winds damaged corn severely in parts of Missouri, and deterioration of both corn and soybeans was noted in southern Illinois. The heat wave was blamed for about 70 deaths in the St. Louis area and hundreds of others elsewhere east of the Rockies.

The month was cooler than normal in the Pacific States, by as much as 4° in a few small scattered areas. Red Bluff, Calif., reported its coolest July since 1903, and central Oregon reported spotty frost on the 3d.

PRECIPITATION.--Drought continued to plague the Northeast during July. Extreme drought at the beginning of the month extended along the Atlantic coast from southern New England to northern Virginia and central and northeastern West Virginia. Much of the area east of the Appalachians from Pennsylvania and New Jersey southward to North Carolina had less than 50 percent of normal rainfall, and a few sections in northern Virginia, central Maryland, and south-central Pennsylvania had less than 25 percent. With the lack of rain and abnormally high temperatures which resulted in rapid evaporation, the area of extreme drought extended over virtually all of West Virginia and over larger portions of Pennsylvania and West Virginia by the end of the month. Harrisburg, Pa., a station in the area of most intense drought, reported its hottest and driest July since 1955, and the least amount of precipitation, 1.86 inches, for the May-June-July period on record. Water levels were the lowest of record in southern New England, New Jersey, and western Maryland.

Drought was also prominent in other sections across the 48 states. The largest area included southern California and western portions of the Great Basin. Nevada, where the drought was worst, has had below normal precipitation for 8 consecutive months, and ranges were depleted.

In western Kentucky and southern portions of Illinois and Indiana precipitation generally was near 50 percent of normal. Some areas, however, were much below 50 percent. Greenville, in southwestern Illinois, reported only 0.28 inch for the entire month of July. This location was part of an area that extended into Missouri and included the St. Louis area where rainfall was the least since 1950. In the southwest Indiana-western Kentucky area, Spurgeon, Ind., reported only 0.34 inch and Henderson, Ky., only 0.45 inch for the month. These areas also had less than 50 percent of normal precipitation in June.

Precipitation was well above normal in north-central areas, particularly in the northern Great Plains and upper Mississippi Valley where many stations reported over 200 percent of their usual July rainfall. This was the wettest July since 1935 at Bismarck, N. Dak. Monthly totals in both the Dakotas ranged up to more than 8 inches.

Summer thunderstorms furnished normal or above amounts of precipitation in most of Arizona and New Mexico. A belt of unseasonably heavy precipitation extended from Washington through northern and western Oregon and along the northern coast of California. Walla Walla, Wash., measured 1.78 inches for the month, the greatest July amount there on record dating back to 1873. Sacramento, Calif., measured 0.09 inch, the greatest amount since 1876.

DESTRUCTIVE STORMS.--Few severe storms occurred during July. On the large Island of Hawaii flooding at Hilo, caused by rainfall ranging up to 17 inches on the mountain slopes, was responsible for damage estimated at several thousand dollars.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.

A Maximum hourly average.
B Number of days maximum 70°F. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data from airport unless otherwise specified. U indicates Urban, R indicates Rural, sites.

Precipitation data in column headed "Greatest in 24 hours" are computed on a 24-hour basis without regard to calendar day and may include precipitation from the last day of the previous month or the first day of the following month.

Wind directions under resultant direction are in tens of degrees.

Value entered in column "Fastest Mile" is the highest observed 1-minute wind speed when the direction is in tens of degrees. These stations are not equipped with a recording anemometer from which "Fastest Mile" data can be evaluated.
A Maximum hourly average.
B Number of days maximum 21.1°C. or above for Alaskan Stations.
Y Peak Gust.
+ And also on an earlier date or dates.
Ø Station pressures apply to elevations shown in the "Elevations - Station Pressure" table of the annual issue of this publication.

Data in this table are obtained by conversion from data in the English Units table.

GENERAL SUMMARY OF RIVER AND FLOOD CONDITIONS

JULY 1966

Elmer R. Nelson, Office of Hydrology

Flooding reported during July in the conterminous United States was mostly minor.

ST. LAWRENCE DRAINAGE

Lake Erie.--Minor flooding occurred on the Sandusky River at Upper Sandusky, Ohio, on the 14th. The small acreage flooded was planted in corn and soybeans and was well enough advanced to survive the high water without damage. This flooding was due to an intense storm early on the morning of the 12th which deposited 4.4 inches over the basin. Most of this rain occurred between the hours of 2 a.m. and 7 a.m.

ATLANTIC SLOPE DRAINAGE

The Satilla River at Atkinson, Ga., was out of its banks on July 1-3. It crested on the 2d, nearly 1 foot above flood stage. No damages were reported.

MISSISSIPPI SYSTEM

Upper Mississippi Basin.--Heavy rains, which totaled as much as 5 inches on the 13th and 14th, caused the Turkey River at Garber, Iowa, to exceed flood stage from the 14th to the 16th. The crest on the 14th was 4 feet above flood stage. Approximately 9,000 acres were flooded. The total damage to crops, fences, and roads was estimated at $160,000. No urban damage was reported.

Missouri Basin.--The James River at Stratford, S. Dak., continued in flood from March 25 to July 14. It crested on April 11 at a stage of 16.75 feet, nearly 3 feet above flood stage. Damage from the flooding occurred in March, April, and the first half of May. There was no additional damage during July in the Stratford area.

The brief minor flooding on Moniteau Creek at Fayette, Mo., on the 29th was due to heavy afternoon thundershowers. There probably was some brief unreported local flooding on small streams near the heaviest rains.

Ohio Basin.--Minor flooding occurred on the Scioto River at La Rue, Ohio, from the 13-15th. This flooding was due to scattered thunderstorms from the 8th to the 14th. The heaviest rainfall occurred on the morning of the 12th. Stage forecasts and flood warnings were beneficial to several communities where the intensity of rainfall was so great as to generate concern for residential areas near the river. Stage forecasts for the lower Scioto were helpful to state highway projects involving bridge and highway construction.

White Basin.--Moderate to heavy rains over portions of the Cache River Basin on July 15-16, 19-20, 23-24, and again on the 29th, caused a slight overflow on the Cache River at Patterson, Ark. The river rose rather abruptly on the 28-29th, exceeding flood stage on the 30th. It was still rising at the end of the month. This small overflow did not cause any damage in July.

WEST GULF OF MEXICO DRAINAGE

Heavy rainfall on June 16-20 caused a slow rise along the lower Trinity. This rise continued downstream during the remainder of June, causing overflow at Moss Bluff, Tex., beginning on June 20 and continuing into July. No additional damage resulted from flooding during July.

Heavy rains up to 7 inches during the early morning of the 7th caused flash flooding on the extreme upper Frio River and tributaries in Texas. Flood warnings were issued in time so that vacationers and other persons could be evacuated from low-lying areas along the Frio River. Flooding occurred downstream, which closed low water crossings for 2 days. Heavily traveled highway U. S. 90 was closed for several hours at a low water crossing. Damages were confined largely to fences, road-washing, and loss of some livestock.
